Electronic Dance Music and Chicago House

A Standing Start: Theory, FL Studio, and the Local Tradition

Compiled for C. Burton

August 2026

Contents

1 EDM and Chicago house: a starting kit **8**

1.0.1 What is here . . . 8
1.0.2 How to use it . . . 9
1.0.3 Two things worth saying up front . . . 9
1.0.4 The LaTeX edition . . . 9
1.0.5 Where the facts come from . . . 9

I Theory **10**

2 What electronic dance music actually is **11**

2.0.1 The one idea that explains everything else . . . 11
2.0.2 The materials . . . 11
2.0.3 Repetition, and why it works . . . 12
2.0.4 The two clocks . . . 12
2.0.5 What ”EDM” means, and the vocabulary trap . . . 12
2.0.6 What makes a genre a genre . . . 13
2.0.7 Where to go next . . . 13

3 Chicago house **14**

3.0.1 The Warehouse, 206 South Jefferson Street . . . 14
3.0.2 The Music Box, and the other temperament . . . 14
3.0.3 The records start . . . 15
3.0.4 The founding records . . . 15
3.0.5 Jack . . . 15
3.0.6 What came after, still in Chicago . . . 16
3.0.7 Why the local connection is worth something . . . 16

4 Rhythm, the grid, and the drum machine **17**

4.0.1 The grid . . . 17

4.0.2 Tempo, and what it means in seconds . . . 17
4.0.3 Four on the floor . . . 18
4.0.4 The full basic house pattern . . . 18
4.0.5 The rest of the kit . . . 19
4.0.6 The classic drum machines . . . 19
4.0.7 Swing . . . 19
4.0.8 Velocity and ghost notes . . . 19
4.0.9 Syncopation . . . 20
4.0.10 Polyrhythm and the three-against-four trick . . . 20
4.0.11 How to practise this . . . 20

5 Music theory, but only the parts house uses 21
5.0.1 Notes and why there are twelve of them . . . 21
5.0.2 Intervals . . . 22
5.0.3 Scales . . . 23
5.0.4 Keys . . . 23
5.0.5 Chords . . . 23
5.0.6 Building chords from a scale . . . 24
5.0.7 Progressions that actually appear in house . . . 24
5.0.8 Voicing and inversions . . . 25
5.0.9 The bass . . . 25
5.0.10 Melody, briefly . . . 25
5.0.11 Picking a key, and harmonic mixing . . . 26
5.0.12 The honest summary . . . 26

6 Sound design: how a synth makes a sound 27
6.0.1 The chain . . . 27
6.0.2 Waveforms . . . 27
6.0.3 Filters . . . 28
6.0.4 Envelopes . . . 28
6.0.5 LFOs . . . 29
6.0.6 Other kinds of synthesis, briefly . . . 29
6.0.7 Sampling . . . 29
6.0.8 The sounds you actually need for house . . . 30
6.0.9 Effects are sound design too . . . 30
6.0.10 How to actually learn this . . . 31

7 Arrangement: turning a loop into a track 32
7.0.1 The power of two . . . 32

7.0.2 The shape of a house track . . . 32
7.0.3 The mechanics of a build . . . 33
7.0.4 Variation: the actual skill . . . 34
7.0.5 Transitions . . . 34
7.0.6 Length, and why . . . 34
7.0.7 How to arrange without going insane . . . 34
7.0.8 The finishing problem . . . 35

8 Mixing, and enough about mastering 36
8.0.1 Gain staging . . . 36
8.0.2 The frequency map . . . 36
8.0.3 EQ, in three rules . . . 37
8.0.4 The kick and bass problem . . . 37
8.0.5 Sidechain compression, the house sound . . . 37
8.0.6 Compression, generally . . . 38
8.0.7 Reverb and delay, on sends . . . 38
8.0.8 Stereo . . . 38
8.0.9 Referencing . . . 39
8.0.10 Loudness and what mastering is . . . 39
8.0.11 Monitoring . . . 39

9 The genre map 40
9.0.1 Four on the floor . . . 40
9.0.2 Broken beat . . . 41
9.0.3 The Chicago family tree . . . 41
9.0.4 Which one should you make? . . . 42

10 Glossary 43
10.0.1 Rhythm and timing . . . 43
10.0.2 Arrangement . . . 43
10.0.3 Harmony . . . 44
10.0.4 Synthesis . . . 44
10.0.5 Sampling . . . 45
10.0.6 Mixing and mastering . . . 45
10.0.7 Software and hardware . . . 46
10.0.8 Machines you will hear named . . . 46
10.0.9 Scene and culture . . . 47

II FL Studio **48**

11 Setup: the first twenty minutes **49**
11.0.1 1. Audio settings, before anything else . . . 49
11.0.2 2. Project settings . . . 49
11.0.3 3. Make a starter template . . . 50
11.0.4 4. Where your files live . . . 50
11.0.5 5. Turn on two things that will save you . . . 50
11.0.6 6. A note on editions . . . 50
11.0.7 Next . . . 51

12 The interface **52**
12.0.1 The one idea that makes FL make sense . . . 52
12.0.2 The five windows . . . 52
12.0.3 Pattern mode versus Song mode . . . 54
12.0.4 Transport and patterns . . . 54
12.0.5 Tools . . . 54
12.0.6 What to ignore for now . . . 55

13 Your first house beat, in twenty minutes **56**
13.0.1 Setup . . . 56
13.0.2 Load four sounds . . . 56
13.0.3 Program the pattern . . . 56
13.0.4 Make it feel human . . . 57
13.0.5 Route to the mixer . . . 57
13.0.6 Balance it . . . 57
13.0.7 Now make it yours . . . 58
13.0.8 Save . . . 58
13.0.9 What you have . . . 58

14 From loop to finished track **59**
14.0.1 1. Organise your patterns first . . . 59
14.0.2 2. The chords . . . 59
14.0.3 3. The bass . . . 60
14.0.4 4. Route everything and set levels . . . 60
14.0.5 5. Sidechain the bass to the kick . . . 61
14.0.6 6. Arrange it . . . 61
14.0.7 7. Make the build build . . . 61
14.0.8 8. Master, lightly . . . 62

14.0.9 9. Export . . . 62
14.0.10 10. Then listen to it somewhere else . . . 62
14.0.11 What to expect . . . 62

15 Keyboard shortcuts **63**
15.0.1 Windows . . . 63
15.0.2 Transport . . . 63
15.0.3 Patterns . . . 63
15.0.4 Files . . . 64
15.0.5 Routing . . . 64
15.0.6 Tools (Playlist and Piano Roll) . . . 64
15.0.7 Editing . . . 64
15.0.8 Mouse conventions worth knowing . . . 65
15.0.9 The three you will use most . . . 65

16 Which plugins actually matter **66**
16.0.1 The six instruments to learn . . . 66
16.0.2 The effects you will use every session . . . 66
16.0.3 The effects worth knowing about . . . 67
16.0.4 What you do not need to buy . . . 67
16.0.5 A rule for plugin browsing . . . 68

17 Troubleshooting **69**
17.0.1 No sound at all . . . 69
17.0.2 Crackling, popping, or stuttering . . . 69
17.0.3 Everything I play is late . . . 69
17.0.4 I hear only drums when I press play . . . 70
17.0.5 My pattern is in the playlist but nothing plays . . . 70
17.0.6 I cannot EQ one sound without affecting everything . . . 70
17.0.7 My kick and bass sound muddy together . . . 70
17.0.8 The exported file sounds different from the project . . . 70
17.0.9 The exported file is distorted . . . 70
17.0.10 I lost my project . . . 70
17.0.11 A plugin window disappeared . . . 71
17.0.12 The project opens with missing samples . . . 71
17.0.13 Everything is too quiet compared to real records . . . 71
17.0.14 It does not sound like the records I like . . . 71
17.0.15 Where to get help . . . 71

III Practice **72**

18 An eight week plan **73**

18.0.1 Week 1: get all the way through the pipeline once . . . 73
18.0.2 Week 2: drums . . . 73
18.0.3 Week 3: harmony . . . 74
18.0.4 Week 4: sound design . . . 74
18.0.5 Week 5: arrangement . . . 74
18.0.6 Week 6: mixing . . . 74
18.0.7 Week 7: speed . . . 74
18.0.8 Week 8: consolidate . . . 75
18.0.9 Rules that make this work . . . 75
18.0.10 What eight weeks will and will not get you . . . 75

19 Drills **76**

19.0.1 Ears . . . 76
19.0.2 Rhythm . . . 76
19.0.3 Harmony . . . 77
19.0.4 Sound design . . . 77
19.0.5 Arrangement . . . 77
19.0.6 Finishing . . . 78
19.0.7 A note on how to use these . . . 78

IV Listening **79**

20 The Chicago canon **80**

20.0.1 The founding six . . . 80
20.0.2 The deep strand . . . 81
20.0.3 The anthems . . . 81
20.0.4 Acid and the harder side . . . 81
20.0.5 The nineties, when Chicago went global . . . 81
20.0.6 Ghetto house and footwork . . . 82
20.0.7 How to listen productively . . . 82
20.0.8 A note on the sound quality . . . 82

21 The scene now **83**

21.0.1 The one that is coming up . . . 83
21.0.2 Clubs . . . 83
21.0.3 Annual events . . . 83

21.0.4 Record shops 84
21.0.5 Radio and online 84
21.0.6 Where to buy the music 84
21.0.7 If you want to meet people 84
21.0.8 Realistic first steps 84

Chapter 1

EDM and Chicago house: a starting kit

Written for someone who has never made a track, does not read music, and lives in the city where this whole thing was invented.

You played guitar and trumpet as a kid, which is more useful than you think. You already know what a beat feels like and you have held an instrument. What you are missing is a vocabulary, a mental model of how a dance record is built, and about six hours of clicking around FL Studio until the layout stops feeling hostile. That is all this is.

1.0.1 What is here

THEORY/ is the reading. Nine files, roughly an hour each if you read slowly and actually stop to listen to the examples.

File	What it covers
`01_what_edm_is.md`	What dance music is *for*, and why that explains almost every formal choice in it
`02_chicago_house.md`	The Warehouse, the Music Box, Trax, acid, ghetto house, footwork. Your local history
`03_rhythm.md`	The grid, four on the floor, swing, the drum machine vocabulary
`04_harmony.md`	Notes, keys, scales, chords, bass lines. Music theory, but only the parts house uses
`05_sound_design.md`	Oscillators, filters, envelopes, LFOs. How a synth actually makes a sound
`06_arrangement.md`	Why everything happens in multiples of 8 bars, and how a track is shaped over six minutes
`07_mixing.md`	Gain staging, EQ, compression, sidechain, loudness
`08_genre_map.md`	Deep house through footwork through techno through drum and bass, with tempos and tells
`09_glossary.md`	Every term you will hear, defined in one line

FL_STUDIO/ is the software. Written against the version you actually have installed (FL Studio 2025, v25.1.4, All Plugins bundle), with the real sample paths and the real keyboard shortcuts checked against Image-Line's manual.

Start with `00_setup.md`, then `02_first_beat.md`. You can make a recognisable Chicago house loop in about twenty minutes without understanding any of the theory. Do that first. The reading makes far more sense once your hands know where things are.

PRACTICE/ is an eight week plan and a list of drills. The plan is the single most important file in here,

because the failure mode for beginners is not lack of knowledge. It is making forty eight-bar loops and never finishing anything.

LISTENING/ is a canon and a scene guide. Chicago house is one of the few genres where the founding documents are all on streaming and most of the founders are, or were until recently, still playing in the city.

1.0.2 How to use it

Suggested first week, in order:

1. `FL_STUDIO/00_setup.md`, then `FL_STUDIO/02_first_beat.md`. Get a kick, clap and hats looping. One hour.
2. `THEORY/01_what_edm_is.md` and `THEORY/03_rhythm.md`. Now the loop you just made will have names attached to it.
3. `LISTENING/chicago_canon.md`. Put on the first five tracks while you read.
4. `THEORY/02_chicago_house.md`.
5. `FL_STUDIO/03_first_track.md`. Add chords and bass, arrange it, export an MP3.

After that, `PRACTICE/8_week_plan.md` takes over.

1.0.3 Two things worth saying up front

You do not need to learn theory before you can make music. House was built almost entirely by people who could not read music and were working out chords by ear on second-hand equipment. Marshall Jefferson bought a piano and taught himself the riff to "Move Your Body" by trial and error. The theory in here is a shortcut for understanding why the things you like sound good, not a licence you have to earn.

The gap between your ears and your hands is the whole difficulty. You have excellent taste already, because you have been listening to music your entire life. Your first tracks will be bad, and you will hear exactly how bad, and that gap is discouraging in a way that has nothing to do with talent. Everyone goes through it. The only known treatment is finishing things.

1.0.4 The LaTeX edition

`tex/` holds a typeset version of everything above: 21 standalone chapter PDFs and one 86-page bound volume, `tex/edm_guide.pdf`.

The markdown is the source of truth. `tex/build.py` converts it with pandoc and wraps it in `tex/preamble.tex`, so editing a markdown file and re-running the script updates the standalone chapter and the bound volume together:

```
cd tex
python build.py --pdf
```

1.0.5 Where the facts come from

Historical dates and details were checked against Wikipedia, Image-Line's manual, and the City of Chicago's landmark designation report for the Warehouse. FL Studio keyboard shortcuts come from Image-Line's official shortcut reference, not memory. Venue and record shop details change, so anything in `LISTENING/chicago_scene_today.md` is worth a search before you get on the train.

Part I

Theory

Chapter 2

What electronic dance music actually is

2.0.1 The one idea that explains everything else

A pop song is designed to be listened to. A dance record is designed to be *played*, by a DJ, into another dance record, in a room full of people who are moving.

That single difference generates almost every formal property of the genre. Once you see it, the conventions stop looking arbitrary.

Because a DJ has to beatmatch two records, the tempo has to be constant. No rubato, no ritardando, no tempo changes for drama. A house record locks to one number for six minutes.

Because a DJ has to blend the end of one record into the start of the next, tracks begin and end with long stretches of nothing but drums. Those are not filler. They are the handles. A record that starts with a full arrangement in bar 1 is hard to mix and DJs will quietly stop playing it.

Because people are dancing, the low frequencies carry the physical information and the rhythm has to be legible from across a loud room. That is why the kick drum is so prominent, why it usually lands on every beat, and why the sound design leans on things you can feel in your chest.

Because a dancer is not tracking a narrative, the song does not need a verse, a chorus and a bridge. It needs a slow accumulation of energy, a release, and enough variation to keep people from noticing that eight minutes have passed. Repetition is the medium, not a failure of imagination. The interest lives in what changes underneath the repetition.

Because the tracks are played in sequence over hours, an individual record does not have to be self-sufficient. It can be a tool. A lot of the best techno is boring on headphones and devastating at 2am in a sequence, and that is not a flaw in the record.

> **The point.** When you cannot decide whether something in your own track is a good idea, ask what it does to a person who is dancing and to the DJ who has to mix out of it. Nearly every convention in the genre falls out of those two readers.

2.0.2 The materials

Almost all dance music is made from four kinds of thing.

Drums. Usually synthesised or sampled from drum machines rather than recorded from a kit. The Roland TR-808, TR-909 and TR-707 are the reference sounds for most of the genre. They are not imitations of acoustic drums; they are their own instruments that happen to occupy the same role.

Bass. One monophonic line in the lowest register, doing the harmonic and rhythmic heavy lifting together. In a lot of house the bass is more important than the chords.

Chords, pads and stabs. The harmonic layer. In house this is very often an electric piano, an organ, a string patch or a short filtered chord ”stab” that plays on an offbeat.

Everything else. Vocals, samples, percussion, noise sweeps, sound effects. The decoration and the identity.

There is no orchestra and no arranger. One person builds all four layers, usually in the same afternoon, usually on a computer.

2.0.3 Repetition, and why it works

The thing that alienates most newcomers is that a house track will play the same two bars forty times. Coming from rock or classical, this reads as poverty.

It is closer to how you would think about a texture than how you would think about a melody. When a pattern repeats long enough, your attention stops tracking the pattern and starts tracking the differences: a hat that opens up, a filter slowly brightening, a new percussion element sliding in. Very small changes become enormous. Removing the kick for four bars, which is nothing on paper, is one of the most dramatic events available in the genre.

This is also why producers obsess over sound quality to an extent that seems neurotic. If the same clap is going to hit 400 times, it had better be a clap worth hearing 400 times.

Steve Reich and Terry Riley got here first, from a completely different direction, and if you ever want to feel better about the intellectual respectability of loops, that lineage is real.

2.0.4 The two clocks

Dance music runs on two timescales at once and you need to hear both.

The fast clock is the bar. Four beats, about two seconds at house tempo. This is where groove lives, and it is the level a dancer's body is locked to.

The slow clock is the phrase. Eight bars, sixteen bars, thirty-two bars. Around fifteen, thirty and sixty seconds respectively at house tempo. This is where the arrangement lives. Changes happen on phrase boundaries almost without exception, and when you learn to feel the eight-bar cycle you will start predicting every change in every track you hear. It is a slightly annoying superpower.

Producers who cannot feel the slow clock make tracks that feel like they are wandering. Almost every ”my arrangement sounds wrong” problem is a phrase problem.

2.0.5 What ”EDM” means, and the vocabulary trap

The abbreviation is genuinely ambiguous and you should know which sense someone means.

In its broad sense, EDM is all of it. House, techno, garage, jungle, drum and bass, dubstep, trance, everything with a programmed beat aimed at a dance floor. Used this way it is just a category label, roughly equivalent to ”rock”.

In its narrow, American, post-2010 sense, ”EDM” means the festival main-stage sound specifically: big-room house, the Beatport top ten circa 2013, Ultra and EDC, the drop as the entire point of the record. Avicii, Skrillex, Martin Garrix.

Most people who make house in Chicago use the second sense, and they use it as a mild insult. If you tell a Smartbar regular you are getting into EDM they will hear something different from what you meant. Say

”house”, or ”dance music”, or name the genre. This is not gatekeeping so much as the ordinary situation where an outsider term and an insider term coexist.

For the record: the music this folder is about is the ancestor of the festival stuff, not a rival to it. House came out of Chicago in 1984 and went to New York, London, Ibiza, Berlin and eventually back to America as a stadium product. Same river, much further downstream.

2.0.6 What makes a genre a genre

Genres in dance music are distinguished by a small number of parameters, and once you know which parameters to check you can identify almost anything.

Tempo is the first thing, and it is a surprisingly hard constraint. House is 118 to 128 beats per minute. Techno is 125 to 145. Drum and bass is 170 to 175, and there is nothing much in between 145 and 165 because those tempos are physically awkward to dance to.

The kick pattern is the second. Four to the floor (a kick on every beat) means house, techno, trance, disco. A syncopated kick with a heavy backbeat means breakbeat, jungle, garage, footwork.

Then swing, the sound palette, the harmonic density, the treatment of vocals, and the sound system the music was designed for. `08_genre_map.md` lays all of this out in a table.

2.0.7 Where to go next

`03_rhythm.md` if you want to start making noise immediately. `02_chicago_house.md` if you want to know whose shoulders you are standing on. Both are short.

Chapter 3

Chicago house

You live about fifteen minutes from where this happened. The building is still standing.

3.0.1 The Warehouse, 206 South Jefferson Street

In 1977 Robert Williams and Siegfried Schuh opened a members-only club in a three-storey building in the West Loop, in what was then a warehouse district with nothing else around it. They brought in a DJ from New York named Frankie Knuckles, who had been playing at the Continental Baths alongside Larry Levan.

The crowd was mostly Black, mostly gay, and mostly there for a very long night. The club ran from Saturday midnight into Sunday afternoon. There was no alcohol licence. People brought their own or drank juice, and the whole thing was oriented around dancing for ten or twelve hours rather than around a bar.

Knuckles was resident from 1977 to 1982. Disco was dying commercially, the records were drying up, and he started extending and rebuilding the ones he had: looping breaks on reel to reel, layering a drum machine underneath a disco record to make it harder and longer, editing tracks to give himself more of the parts that worked. The music he played did not have a name, so people asked record shops for the stuff they heard at the Warehouse. The Warehouse. House.

That etymology is the standard account and it is probably right, though as with all etymologies there are people who will argue. The city landmarked the building in 2024.

3.0.2 The Music Box, and the other temperament

Knuckles left the Warehouse in 1982 over a price increase and opened the Power Plant. Robert Williams reopened the old room as the Music Box and installed Ron Hardy.

If Knuckles was the architect, Hardy was the demolition crew. He played louder, faster, rougher, and considerably more chaotically. He would drop a record, run it backwards, play the same track three times in a night, cut the sound entirely. He was an addict and he died in 1992 at 33, and the recordings of his sets that circulate are genuinely wilder than almost anything DJs do now.

The two clubs are the two poles of house that still exist today. Smooth, soulful, musical, sophisticated on one side. Raw, mechanical, confrontational on the other. Deep house and acid house are the direct descendants.

3.0.3 The records start

Up to about 1983 house was a way of playing other people's records. Then it became a way of making your own, because the equipment got cheap.

The specific reason is worth knowing: the Roland TB-303 and TR-808 had been commercial failures. The 303 was sold as a bass accompaniment for guitarists practising alone and it sounded nothing like a bass guitar, so it flooded the used market. Kids in Chicago bought them for very little money and used them wrong.

Jesse Saunders, "On and On" (1984, Jes Say Records), written with Vince Lawrence, is usually cited as the first house record pressed to vinyl. It exists because a bootleg medley Saunders had been playing got stolen, so he rebuilt it himself with a drum machine and a bassline.

Trax Records (Larry Sherman, 1984) and **DJ International** (Rocky Jones, 1985) became the two labels that carried the sound out of the city. Trax pressed on recycled vinyl and the records sound rough because they literally are, and there is a long and ugly story about royalties that the artists are still fighting over. Both things are true: the label distributed the music worldwide, and it paid the people who made it almost nothing.

3.0.4 The founding records

Marshall Jefferson, "Move Your Body" (1986, Trax). Subtitled "The House Music Anthem", which is the sort of thing you can only get away with if you are right. Jefferson bought a piano on credit and worked out the riff himself. It put acoustic-sounding piano into a drum-machine record and invented an entire subgenre in the process.

Mr. Fingers, "Can You Feel It" (1986). Larry Heard, a drummer by training, made this with a Roland Juno-60 and a TR-909 and essentially nothing else. Sparse bassline, ethereal pads, no vocal on the original. This is where deep house begins, and it still sounds like the future rather than the past.

Phuture, "Acid Tracks" (1987, Trax). DJ Pierre, Spanky and Herb Jackson bought a second-hand TB-303, could not work out how to program a normal bassline on it, and twisted the filter knobs while a pattern looped. The result is the squelching, liquid, screaming sound that defines acid house. Ron Hardy played it at the Music Box for months before it was released, from a cassette, and the crowd called it "Ron Hardy's Acid Track". Marshall Jefferson produced the release.

Steve "Silk" Hurley, "Jack Your Body" (1986). Went to number one in the UK in January 1987, which was the moment Britain worked out what was happening in Chicago.

Farley "Jackmaster" Funk, "Love Can't Turn Around" (1986), with Darryl Pandy's enormous gospel vocal on top, is the other side: house as soul music with a drum machine.

Lil Louis, "French Kiss" (1989). Famous for the long tempo breakdown where the whole record slows to a crawl and then rebuilds. Also famous for the moaning, which got it banned in several places and sold it everywhere else.

3.0.5 Jack

"Jack" is the Chicago verb. To jack is to dance to house in the specific loose-limbed way the music asks for, and a "jack track" is a stripped, hypnotic, mostly drums-and-bass record built for exactly that. Chip E's "Time to Jack", the whole early Trax catalogue.

The word matters because it names the thing that separates Chicago house from the prettier European house that followed. The point is the body, not the melody.

3.0.6 What came after, still in Chicago

Deep house. Larry Heard, and later Ron Trent and Chez Damier's Prescription label, Glenn Underground, Gemini. Jazz chords, seventh and ninth voicings, long evolving pads, a tempo that sits back rather than pushes. This is the most harmonically interesting corner of the genre and the best place to steal chords from.

Ghetto house. Late 1980s onward, centred on Dance Mania records. DJ Funk, DJ Deeon, Paul Johnson, Jammin Gerald. Faster, dirtier, extremely minimal, built on a 909 and a sampler and a lot of obscene chanting. Almost no chords at all. It is the punk of house.

Juke, then footwork. Ghetto house sped up to around 160 BPM, then broken apart. Triplet kick patterns, chopped vocal samples repeated to the point of abstraction, huge amounts of space. RP Boo, DJ Rashad, DJ Spinn, Traxman, the Teklife crew. Footwork is dance music with a literal dance attached: battle circles, two dancers, feet moving faster than seems plausible. Rashad's *Double Cup* (2013) is the record that took it international. He died in 2014.

The 90s house diaspora. Cajmere / Green Velvet (Curtis Jones, who has a chemical engineering degree from Berkeley, which you may enjoy), Cajual and Relief Records, DJ Sneak, Derrick Carter, Mark Farina, Gene Farris, Paul Johnson. This is the generation that made Chicago house a global club standard rather than a historical artefact.

3.0.7 Why the local connection is worth something

Two practical reasons, beyond civic pride.

First, the source material is unusually accessible. You can go to Gramaphone, you can go to the Chosen Few Picnic, you can stand outside 206 S. Jefferson. Most people learning a genre are learning it from a distance.

Second, and more usefully: the Chicago tradition is technically forgiving. These records were made on cheap gear by people who were learning as they went. The production is often crude by modern standards, the mixes are strange, and none of that matters because the groove and the feeling carry it. If you were trying to learn by imitating modern festival-tier production you would be competing against people with twenty years of mixing experience and mastering engineers. Imitating a 1986 Trax record is a fair fight.

Go and hear it. `LISTENING/chicago_canon.md` has the list, with a specific thing to follow in each record. Six tracks will take you about two hours and will do more for your ear than this chapter did.

Chapter 4

Rhythm, the grid, and the drum machine

This is the file to read first if you only read one. Harmony is optional in house. Rhythm is not.

4.0.1 The grid

Everything is built on a grid of sixteen equal slots per bar. Producers call them steps. Four beats to a bar, four steps to a beat.

Counted aloud, drummers say it like this:

```
Step     1   .   .   .   5   .   .   .   9   .   .   .  13   .   .   .
Count    1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
```

The numbers are the beats. The "&" is halfway between two beats, which musicians call the offbeat or the upbeat. The "e" and "a" are the sixteenth-note subdivisions.

When you open the Channel Rack in FL Studio you get exactly this: sixteen buttons in a row. That is not a simplification for beginners. It is how the original drum machines worked and it is how most house is still programmed.

4.0.2 Tempo, and what it means in seconds

Tempo is beats per minute. House lives between 118 and 128 BPM, and 122 to 126 is the middle of the road. Pick 124 and stop thinking about it for now.

You will need the conversion from BPM to milliseconds constantly, because delay times, reverb decays and LFO rates all get set in musical units that you sometimes have to translate:

```
milliseconds per beat = 60000 / BPM
```

At 124 BPM	Duration
One bar (4 beats)	1935 ms
One beat (1/4 note)	484 ms
One eighth (1/8)	242 ms
One sixteenth (1/16)	121 ms
Dotted eighth	363 ms
Eighth triplet	161 ms

At 124 BPM	Duration
8 bars	15.5 s
16 bars	31.0 s
32 bars	62.0 s

That last block is why house tracks are six or seven minutes long. A track with an intro, a build, two main sections, a breakdown and an outro, all in 32-bar blocks, is going to run past six minutes whether you planned it or not.

The dotted eighth is worth remembering separately. A delay set to a dotted eighth produces the classic offbeat echo you hear on everything from dub to The Edge's guitar, because it cycles against the beat instead of on it.

4.0.3 Four on the floor

The defining pattern of house, techno, disco and trance is a kick drum on every single beat. Four kicks per bar, evenly spaced. Hence the name.

```
Count     1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
Kick      X   .   .   .   X   .   .   .   X   .   .   .   X   .   .   .
```

It is metronomic and it is supposed to be. It gives the dancer an unambiguous pulse that survives a loud room, and it gives the DJ something to beatmatch. It also does something psychoacoustically useful: it masks the low end four times a bar, which is why sidechain compression became standard (see `07_mixing.md`).

4.0.4 The full basic house pattern

Add a clap on beats 2 and 4, and an open hi-hat on every offbeat.

```
Count     1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
Kick      X   .   .   .   X   .   .   .   X   .   .   .   X   .   .   .
Clap      .   .   .   .   X   .   .   .   .   .   .   .   X   .   .   .
Open hat  .   .   X   .   .   .   X   .   .   .   X   .   .   .   X   .
```

Those three lines are a house record. Genuinely. Load a 909 kick, a 909 clap and a 909 open hat, program that, and you have something you could play out. Everything else in this folder is decoration on top of those twelve hits.

Two things to notice.

The clap on 2 and 4 is the **backbeat**, and it is inherited from soul, funk and rock. It is the part of the pattern that makes house feel like Black American dance music rather than like European electronic music. Techno often drops it entirely, and that is a large part of why techno feels colder.

> **Why this works.** The open hat on the offbeat is the part that makes it *move*. The kick pulls you down four times a bar; the hat pulls you up in between. That tension is the whole engine. Mute the offbeat hat and listen to the loop go flat.

4.0.5 The rest of the kit

Closed hi-hat, on sixteenths or eighths, fills in the texture and controls how busy the track feels. Sixteenths make it drive. Eighths make it breathe.

Ride and crash mark transitions rather than keeping time. A crash on the downbeat of a new section is one of the oldest tricks there is and it still works.

Percussion, meaning congas, bongos, shakers, rimshots, cowbell, tambourine, is where the personality lives. Latin percussion has been part of house since the beginning because disco was full of it. A shaker on sixteenths and a conga pattern that resolves every two bars will do more for a boring loop than any amount of new synth work.

Snare rolls and hat rolls are build-up tools, not groove tools. See `06_arrangement.md`.

4.0.6 The classic drum machines

You will see these names constantly and they are worth being able to identify by ear.

Roland TR-909 (1983). The house and techno machine. Punchy analogue kick with a very audible click at the front, sharp snappy snare, and sampled metal for the hats and cymbals, which is why 909 hats sound thin and crisp rather than round. The kick has a pitch envelope you can tune, which is why 909 kicks can be made to sit in key with the bass. If you learn one drum machine, learn this one.

Roland TR-808 (1980). Longer, deeper, boomier kick that sustains rather than punches. Cowbell, congas, that specific clap. It went to hip-hop and electro more than to house. An 808 kick in a house track will muddy your low end unless you shorten it, because the tail overlaps the next kick.

Roland TR-707 (1985). Sampled acoustic-ish sounds, cheaper and thinner than either. Used all over early Chicago records because it was affordable. Worth trying when you want something drier.

You have all three sampled in FL Studio already. `FL_STUDIO/02_first_beat.md` gives the exact file paths.

Roland TB-303 (1981). Not a drum machine, a bassline synth, but it belongs in this list because it is the other founding instrument of Chicago music. See `05_sound_design.md` and the acid section of `02_chicago_house.md`.

4.0.7 Swing

A straight grid divides each beat into two exactly equal halves. Swing delays the second half.

The amount is usually given as a percentage, where 50% is straight and 66.7% is a full triplet feel. House usually sits somewhere between 52% and 58%, which is a small enough shift that you might not consciously hear it but will absolutely feel it. Garage and UK house push much further, to 60% and beyond.

Swing is the single biggest lever between ”this sounds like a machine” and ”this sounds like a groove”. If your loop feels stiff, try swing before you try anything else. In FL Studio there is a swing knob right on the Channel Rack.

> **Watch out.** Apply swing to hats and percussion, not usually to the kick. A swung kick in a four-on-the-floor track stops being four on the floor.

4.0.8 Velocity and ghost notes

Every hit has a velocity, a number from 0 to 127 that usually maps to loudness and often also to brightness. A pattern where every hit is at 127 sounds like a fax machine.

Real drummers hit the accented notes hard and fill the gaps with quiet ones. Copy this. Sixteenth hats with alternating loud and quiet hits, or a repeating loud-quiet-medium-quiet cycle, immediately sound more like playing and less like programming. Those quiet in-between hits are called ghost notes.

The Channel Rack in FL Studio has a graph editor underneath the steps for exactly this. Use it on every hat pattern you ever write.

4.0.9 Syncopation

Syncopation means placing accents where the meter does not expect them: on offbeats, on the ”e” and ”a”, across the barline.

House uses it in a very specific way. The kick is completely unsyncopated, and everything else is syncopated against it. The bass plays on the offbeats. The chord stabs land on the ”&”. The percussion falls between the kick hits. This is why house feels simultaneously rigid and loose.

The classic offbeat bass pattern, where the bass note sits exactly between the kicks:

```
Count     1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
Kick      X   .   .   .   X   .   .   .   X   .   .   .   X   .   .   .
Bass      .   .   X   .   .   .   X   .   .   .   X   .   .   .   X   .
```

That is most of disco and a huge fraction of house. It also solves a mixing problem for free, because the bass never plays at the same instant as the kick and so they never fight.

4.0.10 Polyrhythm and the three-against-four trick

Put a percussion element on every third sixteenth instead of every fourth. It will cycle against the bar and take three bars to line up again.

```
Count     1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
Perc      X   .   .   X   .   .   X   .   .   X   .   .   X   .   .   X
```

This is a cheap and extremely effective way to make a loop feel like it is evolving when nothing is actually changing. Use it sparingly. Two competing polyrhythms turn into mud.

4.0.11 How to practise this

Put on any house record and clap the offbeat, the ”&” between the kicks, for a full three minutes. Not the kick. The gap. It is harder than it sounds and it will rewire how you hear the genre.

Then open FL Studio and rebuild the drum pattern of a track you like by ear, one element at a time. `PRACTICE/exercises.md` has a structured version of this.

Chapter 5

Music theory, but only the parts house uses

You do not need this to start. You need it to stop guessing.

I have written this assuming you are comfortable with logarithms and ratios, because that makes the first section take five minutes instead of an hour.

5.0.1 Notes and why there are twelve of them

Pitch is frequency. Double a frequency and you get a note that sounds like the same note, higher. That 2:1 ratio is the octave, and it is the one interval that is essentially universal across musical cultures.

Western music divides the octave into twelve equal steps on a logarithmic scale. One step is a semitone, and the frequency ratio is

```
2^(1/12) = 1.059463...
```

so twelve of them multiply to exactly 2. This system is called twelve-tone equal temperament. Every semitone is the same size, which means you can transpose anything to any key and it still works. The price is that no interval except the octave is exactly a small-integer ratio: a perfect fifth in equal temperament is 2^(7/12) = 1.4983 instead of 1.5. Nobody can hear the difference in a club.

The reference point is A4 = 440 Hz. From any MIDI note number n:

```
f = 440 × 2^((n − 69) / 12)
```

The twelve notes are named A, A#/Bb, B, C, C#/Db, D, D#/Eb, E, F, F#/Gb, G, G#/Ab. The sharps and flats are the black keys. The reason the naming is irregular (no E# or B#) is historical and not worth your time.

An FL Studio trap, worth knowing now

> **The trap.** FL Studio labels middle C as **C5**. Most other software, and most theory writing, calls it C4. FL's octave numbers are one higher than the scientific convention throughout, so every note name

you read in a tutorial written for another program is off by an octave.

This matters when you follow a tutorial written for Ableton, or when you read a synth manual. It is not a bug, just an inherited quirk. Practical version, in FL's own labels:

Layer	Rough range in FL note names
Sub bass and kick fundamentals	C2 to C3
Bassline	C2 to C4
Chords	C4 to C6
Lead / melody	C5 to C7

And for tuning a kick drum or a sub, the frequencies in FL's labelling:

FL note	Hz
C2	32.7
D2	36.7
E2	41.2
F2	43.7
G2	49.0
A2	55.0
B2	61.7
C3	65.4

A typical house kick has its fundamental between 45 and 65 Hz, so somewhere around G2 to C3. See `07_mixing.md` for why tuning it to your track's key is worth doing.

5.0.2 Intervals

The distance between two notes, counted in semitones. These are the building blocks of everything else, and the names are worth memorising because chord names are built from them.

Semitones	Name	Sounds like
1	minor 2nd	tense, adjacent
2	major 2nd	a step
3	minor 3rd	sad
4	major 3rd	happy
5	perfect 4th	open, suspended
6	tritone	unstable
7	perfect 5th	hollow, strong, stable
8	minor 6th	melancholy
9	major 6th	warm
10	minor 7th	jazzy, unresolved
11	major 7th	dreamy, floating
12	octave	the same note

The minor third versus major third distinction is the single most important one. It is the difference between sad and happy, and it is one semitone.

5.0.3 Scales

A scale is a subset of the twelve notes that you agree to mostly stay inside. Picking one is what makes a piece sound coherent rather than random.

Written as semitone steps between consecutive notes:

Scale	Steps	Character
Major	2 2 1 2 2 2 1	bright, resolved
Natural minor	2 1 2 2 1 2 2	sad, the default for house
Dorian	2 1 2 2 2 1 2	minor but with a lifted 6th; funky, soulful
Phrygian	1 2 2 2 1 2 2	dark, Spanish, used in hard techno
Harmonic minor	2 1 2 2 1 3 1	dramatic, exotic; use with care

Starting on A, the natural minor scale is A B C D E F G, all white keys. That is why A minor is where beginners should start: no accidentals to keep track of.

Dorian is worth special attention. It is natural minor with the sixth note raised one semitone (A B C D E **F#** G). That single note is most of the difference between ”sad” and ”cool”. A huge amount of deep house and disco sits in Dorian.

5.0.4 Keys

A key is a scale plus a home note. ”A minor” means the natural minor scale starting from A, with A as the note everything wants to return to.

Two facts that save time:

Every major key has a **relative minor** using exactly the same notes, starting three semitones lower. C major and A minor contain identical notes. So do F major and D minor, G major and E minor.

House is overwhelmingly in **minor keys**. A minor, F minor, G minor, C minor, D minor. Partly because minor sounds better against dark club sound systems, partly because the whole genre inherited its emotional register from disco and soul, which are full of yearning rather than triumph.

Practical advice: write everything in A minor for your first month. When it starts feeling constraining, move to F minor, which is the other workhorse key of the genre.

5.0.5 Chords

A chord is three or more notes at once. Named by their root and their pattern of intervals above it, in semitones:

Chord	Semitones above root	Example on A
minor triad	0, 3, 7	A C E
major triad	0, 4, 7	A C# E
diminished	0, 3, 6	A C Eb
sus2	0, 2, 7	A B E
sus4	0, 5, 7	A D E
minor 7th (m7)	0, 3, 7, 10	A C E G
major 7th (maj7)	0, 4, 7, 11	A C# E G#
dominant 7th (7)	0, 4, 7, 10	A C# E G
minor 9th (m9)	0, 3, 7, 10, 14	A C E G B
major 9th (maj9)	0, 4, 7, 11, 14	A C# E G# B

Chord	Semitones above root	Example on A
add9	0, 4, 7, 14	A C# E B
minor 6th (m6)	0, 3, 7, 9	A C E F#

Why house lives on 7ths and 9ths

A plain triad is stark and finished. It states a fact and sits down.

Add the 7th and the chord becomes slightly unresolved: pleasant, hanging, in no hurry. Add the 9th and it becomes lush. This is the sound of Rhodes pianos, of Larry Heard, of basically all deep house.

Why this works. House harmony usually does not *move* anywhere. A rock song sets up tension and resolves it. A house track loops two chords for six minutes. A plain triad loop gets boring because each chord keeps announcing that it has arrived. A 7th chord never quite lands, so it can repeat indefinitely without demanding a resolution that never comes.

If your chords sound amateurish, this is almost always the reason. Add the 7th.

5.0.6 Building chords from a scale

Take your scale, and build a chord on each note using only notes from that scale. In A natural minor:

Degree	Chord	Notes	Roman numeral
1	A minor 7	A C E G	i7
2	B minor 7 flat 5	B D F A	ii°7
3	C major 7	C E G B	IIImaj7
4	D minor 7	D F A C	iv7
5	E minor 7	E G B D	v7
6	F major 7	F A C E	VImaj7
7	G dominant 7	G B D F	VII7

Roman numerals are the standard shorthand. Lowercase means minor, uppercase means major. The point of the notation is that it is key-independent: ”i, VI, III, VII” describes a progression you can transpose anywhere.

5.0.7 Progressions that actually appear in house

Written in A minor. Transpose freely.

The two-chord vamp: Am7 to Dm7 (i to iv). Two bars each. This is the deep house default and it is not a cop-out. ”Can You Feel It” territory. Because both chords are minor 7ths and they share notes, the loop feels like breathing rather than like a chord change.

i, VI, III, VII: Am7, Fmaj7, Cmaj7, G. The most common minor progression in all popular music. Melancholy but forward-moving. One bar each, or two if you want it to feel patient.

i, VII, VI, VII: Am7, G, Fmaj7, G. Descends then turns around. Slightly more anthemic.

ii, V, i: Bm7b5, E7, Am7. Borrowed from jazz. Use it as a four-bar turnaround at the end of an eight-bar phrase to make things feel less mechanical.

ii, V, I in the relative major: Dm7, G7, Cmaj7. The single most common progression in jazz, and it shows up all over deep house and nu-disco. Warmer than the minor options.

i to v: Am7 to Em7. Very static, very hypnotic. Good for techno-leaning house where you want almost no harmonic information.

In F minor, the other house key: Fm7 to Bbm7, or **Fm7, Dbmaj7, Abmaj7, Eb.** Same shapes, darker register.

5.0.8 Voicing and inversions

Which notes you play matters less than where you put them.

An **inversion** is the same chord with a different note at the bottom. Am7 as A-C-E-G is root position. C-E-G-A is the first inversion. Same chord, different colour, and crucially, smoother movement between chords.

The rule that fixes most beginner chord work: **when moving between chords, move each note as little as possible.** Instead of playing Am (A C E) then F (F A C) with both hands jumping down, play Am as A-C-E and F as A-C-F. Only one note moved. This is called voice leading and it is why professionally written chords sound smooth and yours sound blocky.

Two more practical rules:

Do not stack notes below about C4 in FL's labelling. Low intervals turn to mud fast. If you want low weight, that is the bass part's job, and it should be a single note.

Leave out notes. A four-note chord played by four fingers is a piano habit. On a synth pad you often want just the root, the 3rd and the 7th, with the 5th dropped entirely, because the 5th adds almost no information and takes up space.

5.0.9 The bass

In house the bassline is the most important melodic element and it usually does one of three jobs.

Root notes on the offbeat. The bass plays the root of the current chord, on the ”&” of every beat, out of the way of the kick. Simple, disco, works every time. See the pattern in `03_rhythm.md`.

Octave bounce. Alternate the root note between two octaves. Root low, root high, root low, root high. Instantly adds movement without adding harmony.

A proper line. Root, 5th, octave, minor 7th, back down. Now the bass is a melody. This is where funk and disco basslines come from, and it is the hardest of the three to do without it becoming busy.

Whatever you do, the bass should be **monophonic**, meaning one note at a time. Chords in the bass register are muddy. Almost every ”why does my low end sound bad” question comes down to either two-note bass chords or a bass that overlaps the kick in time.

5.0.10 Melody, briefly

House often has no melody at all, and this is fine. When it does, the melody is usually short, repetitive, and made of notes already in the chords underneath.

The most reliable way to write one that works: pick notes from the current chord for the strong beats, and pass through other scale notes on the way between them. That is the entire technique.

The **pentatonic scale** is a cheat code worth knowing. It is the minor scale with the two awkward notes removed: A C D E G. Every note in it sounds acceptable over every chord in the key. If you improvise using

only those five notes in A minor you will not play a wrong note. Set your FL piano roll scale highlight to it and click around.

5.0.11 Picking a key, and harmonic mixing

For your own tracks, key choice barely matters musically. A minor and F minor are fine forever.

It matters for DJs, because two records in clashing keys sound bad played together. The standard tool is the **Camelot wheel**, a relabelling of the circle of fifths where each key gets a code like 8A or 5B. Keys with adjacent numbers, or the same number with the other letter, mix well. Software like Mixed In Key does the detection automatically, and Beatport lists keys on every track.

You do not need this yet. Know that it exists so the numbers on Beatport stop being mysterious.

5.0.12 The honest summary

Almost every house track ever made can be described as: one minor key, two to four seventh chords looping every two or four bars, a monophonic bassline on the roots, and a melody made of chord tones. That is the whole harmonic language.

The interest is elsewhere. It is in the groove, the sound design and the arrangement. Do not spend six months on theory when the actual differentiator is whether your hi-hats swing.

Chapter 6

Sound design: how a synth makes a sound

Every synthesiser you will ever open is a variation on the same three-stage chain, with two kinds of controller wired across it. Learn the chain once and every plugin becomes legible.

6.0.1 The chain

```
OSCILLATOR  ->  FILTER  ->  AMPLIFIER  ->  out
                  ^            ^
                  |            |
              ENVELOPE     ENVELOPE
                 LFO          LFO
```

The **oscillator** makes a raw tone with a lot of harmonic content.

The **filter** removes some of those harmonics. This is where most of the character comes from.

The **amplifier** controls the volume over time, which is what makes a sound a stab, a pluck or a pad.

Envelopes and **LFOs** are not audible themselves. They are controllers that move the other things around over time.

This is called **subtractive synthesis**, because you start with something harmonically rich and carve away. It is the dominant method in dance music and it is what the TB-303, the Juno-60 and roughly everything else in this folder are doing.

6.0.2 Waveforms

The oscillator's shape determines which harmonics are present. The harmonics are integer multiples of the fundamental frequency, and the amplitude pattern is what your ear reads as timbre.

Wave	Harmonics present	Amplitude falls off as	Sounds like
Sine	fundamental only	n/a	pure, hollow, a whistle. The building block of sub bass
Triangle	odd only	$1/n^2$	soft, flute-like, slightly more body than a sine
Square	odd only	$1/n$	hollow, woody, reedy. Classic for basses and leads
Sawtooth	all	$1/n$	bright, buzzy, aggressive. The most harmonically rich, and the default for pads and supersaws

Wave	Harmonics present	Amplitude falls off as	Sounds like
Noise	all, randomly	flat	hiss. Used for percussion, risers and texture

Two practical consequences.

A sine has nothing to filter, so a lowpass filter does nothing interesting to it. That is why sub basses are usually sines with no filter movement at all.

A saw has everything to filter, so it responds enormously to filter movement. That is why every filter sweep you have ever heard in dance music is a saw wave underneath.

A **pulse wave** is a square with an adjustable duty cycle. Modulating that duty cycle (pulse width modulation, PWM) gives you the thick, shifting, slightly detuned sound of 1980s string machines. The Juno-60 that Larry Heard used for "Can You Feel It" is doing exactly this.

6.0.3 Filters

A filter attenuates frequencies above or below a cutoff point.

Lowpass (LPF) passes low frequencies and removes highs. This is the one you will use 90% of the time. Closing a lowpass makes a sound darker, more distant, more muffled.

Highpass (HPF) does the opposite. Essential in mixing: highpass everything that is not the kick and bass to clear out the low end.

Bandpass passes a band and removes everything either side. Telephone or radio effects, and useful for making a sound sit in a narrow slot.

Notch removes a narrow band and passes the rest.

Two controls matter:

Cutoff is the corner frequency. Sweeping cutoff on a saw wave is the single most recognisable gesture in electronic music.

Resonance boosts the frequencies right at the cutoff point. A little adds bite and focus. A lot makes the filter ring and whistle, and at extreme settings the filter self-oscillates and becomes a sine wave generator in its own right. Acid house is entirely about high resonance.

Slope is how steeply the filter cuts, in decibels per octave. 12 dB/octave (2-pole) is gentle. 24 dB/octave (4-pole) is the Moog ladder sound, tighter and more dramatic. The TB-303 uses an unusual 18 dB/octave design, which is part of why acid basslines sound the way they do and not like every other synth.

6.0.4 Envelopes

An envelope describes how a parameter changes over the life of a single note. The standard form has four controls, universally abbreviated **ADSR**.

Attack is the time from the note starting to the peak. Zero attack means the sound begins instantly, which is what you want for anything percussive. Long attack means it fades in, which is what makes a pad a pad.

Decay is the time from that peak down to the sustain level.

Sustain is a **level, not a time**. It is how loud the sound stays while you keep holding the key.

Common mistake. Reading sustain as a duration. Three of the four ADSR controls are times and the fourth is not, which is why beginners set sustain to zero expecting silence and get a pluck instead.

Release is the time it takes to fade to silence after you let go.

An organ has full sustain and no decay: it stays until you release. A piano has zero sustain and a long decay: it starts loud and fades even while you hold the key. A pluck is fast attack, fast decay, zero sustain.

The single most useful trick in synthesis: route an envelope to the **filter cutoff** as well as the volume. A short filter envelope on a saw wave gives you the "wow" at the front of the note that makes a bass sound alive. Almost every good bass patch is doing this.

6.0.5 LFOs

A low frequency oscillator is an oscillator running below hearing range, used as a controller rather than as a sound. Typical rates are a fraction of a hertz up to about 20 Hz.

Route an LFO to:

- **pitch**, slowly and shallowly, for vibrato
- **volume** for tremolo
- **filter cutoff** for the wobbling, breathing quality on pads and, taken to extremes, for dubstep basses
- **pan** for movement in the stereo field

In dance music LFOs are almost always **tempo-synced**, meaning their rate is locked to a musical division (one cycle per bar, per beat, per 1/8) instead of a free-running frequency. FL Studio does this with a tempo-sync button on every LFO.

6.0.6 Other kinds of synthesis, briefly

FM synthesis uses one oscillator to modulate the frequency of another at audio rate. This generates complex, often inharmonic sidebands. It is brilliant for bells, metallic sounds, electric pianos and gnarly basses, and it is much harder to control intuitively than subtractive. In FL Studio: **Sytrus**.

Additive synthesis builds sounds by summing individual sine partials, giving you direct control over each harmonic. Very powerful, very fiddly. In FL Studio: **Harmor** and **Ogun**.

Wavetable synthesis scans through a table of stored single-cycle waveforms, so the timbre morphs as you move through the table. This is the dominant modern method and the reason Serum became ubiquitous. In FL Studio: the wavetable mode in **FLEX**, or third party plugins like Serum and Vital.

Physical modelling simulates the physics of a real instrument rather than the sound. In FL Studio: **Sakura** for strings, **Drumaxx** for drums.

Granular synthesis chops audio into tiny grains and reassembles them. Textural and strange. In FL Studio: **Fruity Granulizer**.

Do not learn all of these. Learn subtractive properly and you can make 95% of house.

6.0.7 Sampling

Sampling is using recorded audio instead of a synthesised waveform, and it is at least half of what dance music is made of.

One-shots are single hits: a kick, a clap, a stab. Load, trigger, done. Your drums will mostly be one-shots.

Loops are pre-recorded bars of audio. Useful but dangerous, because a loop someone else made carries their groove and their sound, and a track built entirely from loops sounds like a track built entirely from loops.

Chopping and slicing means cutting a longer sample into pieces and replaying them in a new order. This is the foundation of hip-hop, jungle, and all of Chicago footwork. In FL Studio: **Slicex** and **Fruity Slicer**.

Time stretching changes the length of a sample without changing its pitch, so you can fit a sample recorded at 100 BPM into a 124 BPM track. FL Studio does this automatically when you enable stretching on an audio clip.

Two things to know about **vocal samples**, which are central to house. First, the classic Chicago approach is a full soulful vocal over the whole track, gospel-derived, sung properly. Second, the modern approach is the **vocal chop**: a short fragment of a vocal, pitched and sequenced like an instrument. Both are house. They just come from different decades.

On the legal question, because it will come up: sampling a commercial record without clearance is copyright infringement, and the fact that everyone did it in 1987 does not mean you can now. For learning, sample whatever you like. Before you release anything, use royalty-free sample packs, vocals you have licensed or recorded yourself, or public domain material.

6.0.8 The sounds you actually need for house

The kick. A 909 kick is a sine-ish body with a fast downward pitch envelope and a click at the front. You can build one from scratch in FL's **Fruit Kick** or **BassDrum** plugin, but you should start with the sampled `909 Kick.wav` that ships with FL and only build your own once you know what you are trying to make.

The clap. Several noise bursts a few milliseconds apart, band-passed around 1 kHz, with a short reverb tail. That tiny stagger is why a clap sounds like several people and not one. Use `909 Clap.wav`.

The hats. Filtered noise plus metallic partials, gated very short for closed and longer for open. Highpass everything below about 300 Hz. `909 CH 1.wav` and `909 OH.wav`.

The acid bass. A sawtooth or square through a resonant lowpass, with a filter envelope, plus two things that are specific to the 303: **slide** (portamento between overlapping notes) and **accent** (certain notes hit harder and open the filter more). Without slide and accent you have a filtered bass, not an acid line. FL Studio ships **Transistor Bass**, which is a 303 emulation, and it is genuinely good. Load it, set resonance high, and turn the cutoff knob while a 16th-note pattern loops. That is acid house.

The chord stab. A short, filtered, heavily enveloped chord played on the offbeat. Often a sampled organ, a Rhodes, or a brass patch. Fast attack, short decay, no sustain. The Chicago version is usually drier and more mechanical than the New York version.

The pad. Saw or PWM, slow attack, long release, lowpass filter mostly closed, plenty of reverb, gentle LFO on the cutoff. This is the layer that gives deep house its atmosphere. In FL Studio, **FLEX** has a lot of usable ones out of the box.

The Rhodes / electric piano. FL's **FL Keys** does a passable one. Play seventh and ninth chords on it and you are immediately in deep house territory.

6.0.9 Effects are sound design too

Reverb puts a sound in a space. Short reverbs make things feel close and real, long ones make them feel distant and dreamy. Use it on a **send**, not on every channel individually (see `07_mixing.md`).

Delay is discrete echoes. Tempo-synced to a dotted eighth is the classic dance music setting. A ping-pong delay alternates between left and right and instantly widens a mono sound.

Chorus duplicates the signal, detunes and delays the copy slightly, and mixes it back. Makes anything thicker and wider. The Juno's built-in chorus is a large part of why those records sound the way they do.

Distortion and saturation add harmonics. A little on a kick or a bass adds weight and makes it audible on small speakers. A lot is a creative choice.

Bitcrushing and sample rate reduction deliberately degrade the signal. Good for that gritty, early-hardware texture.

Filter automation on an effect send is how you do the classic house breakdown, where everything gets muffled and distant and then snaps back.

6.0.10 How to actually learn this

Do not read synth manuals. Do this instead, once, for an hour:

Open **3x Osc** in FL Studio, which is deliberately primitive. Set one oscillator to a sawtooth and turn the other two off. Play and hold a note. Now, one at a time and listening the whole way:

1. Sweep the filter cutoff from fully open to fully closed.
2. Put resonance to about 70% and sweep again.
3. Set the volume envelope attack to maximum, then back to zero.
4. Set the decay short and sustain to zero. You now have a pluck.
5. Route the envelope to the filter and repeat step 4.
6. Add an LFO to the cutoff, sync it to 1/4, and listen.

After that hour, every synth you open for the rest of your life will make sense. The controls are always the same controls.

Chapter 7

Arrangement: turning a loop into a track

This is where beginners get stuck, permanently. Making a good eight-bar loop is easy and satisfying. Turning it into six minutes that hold attention is a different skill, and almost nobody teaches it because it is less fun to talk about than synths.

7.0.1 The power of two

Dance music counts in bars, and bars are grouped into phrases of 4, 8, 16 and 32. Changes happen on phrase boundaries. Not near them. On them.

At 124 BPM:

Length	Duration
1 bar	1.9 s
4 bars	7.7 s
8 bars	15.5 s
16 bars	31.0 s
32 bars	62.0 s

Eight bars is the basic unit of change. Sixteen is the basic unit of a section. Thirty-two is a full section in a longer track.

This is not a stylistic preference, it is a functional requirement. DJs mix in and out on phrase boundaries, and a track whose sections start on bar 13 will not line up with the record playing against it. Breaking the rule is possible and occasionally great, but you should be able to hear the rule before you break it.

> **In practice.** If your arrangement feels like it is wandering, count the bars between changes. It will almost always turn out that something is happening on bar 7 or bar 21.

7.0.2 The shape of a house track

The standard form, and a concrete map you can copy directly into FL Studio's playlist. This is 176 bars, which at 124 BPM is 5 minutes 41 seconds.

Bars	Section	Time	What is playing
1 to 16	Intro	0:00	Kick, hats, maybe one percussion element. Nothing else

Bars	Section	Time	What is playing
17 to 32	Intro 2	0:31	Add bass, clap, more percussion
33 to 64	Main 1	1:02	Everything. Chords, vocal, the full groove
65 to 80	Breakdown	2:04	Drums out. Chords and atmosphere only
81 to 96	Build	2:35	Tension. Riser, snare roll, filter opening
97 to 128	Main 2	3:06	The biggest section. Full arrangement plus whatever you held back
129 to 144	Main 2 variation	4:08	Change one thing. Drop an element, add a counter-melody
145 to 160	Outro	4:39	Strip back. Chords and bass out
161 to 176	Outro 2	5:10	Drums only, then stop

Three things about this that are easy to miss.

The first 30 seconds are almost empty and that is correct. It feels wrong when you are making it, because you are listening to it in isolation and it is boring. It is not going to be heard in isolation. It is going to be heard underneath the last minute of the previous record. That empty intro is a mixing handle, and it is the difference between a track DJs play and a track DJs skip.

The outro mirrors the intro. Same reason.

The energy is not a straight line. It climbs, drops out completely at the breakdown, climbs harder, and peaks in Main 2. The breakdown is not a rest, it is a setup. The drop hits hard *because* you took everything away first, and for no other reason.

7.0.3 The mechanics of a build

The build is the 16 bars before the biggest moment in your track, and it is the most technical part of arranging. You are manufacturing tension, which means increasing several parameters simultaneously and then releasing all of them at once.

Tools, roughly in order of how often they are used:

Filter automation. Open a lowpass filter gradually across the build so the whole track brightens. Or close a highpass so the low end returns. Both work.

Risers. A noise sweep or a rising synth tone. FL ships a folder of them under Packs. They are a cliché and they are a cliché because they work.

Snare or hat rolls. Start with hits every 1/4, then 1/8, then 1/16, then 1/32 over the last two bars. Increasing subdivision rate is read by the brain as accelerating even though the tempo is constant.

Rising pitch. Automate the pitch of a percussion element or a riser upward.

Volume and reverb increase. More reverb makes things feel bigger and less defined, which is useful right before you want dry clarity.

The silence before the drop. Cut everything for the last half bar or one beat. This is the single most effective trick in the entire genre and it costs nothing.

Then on the downbeat of the drop: everything returns, all filters open, and a crash cymbal marks the boundary.

Two failure modes. If your build has all these things at maximum for all 16 bars, there is nowhere left to go. Start low. And if you build for 16 bars and then the drop is the same arrangement that was playing before the breakdown, it will feel like a let-down. Hold something back: a percussion layer, a counter-

melody, an octave of the bass.

7.0.4 Variation: the actual skill

The reason a good producer's loop holds for 32 bars and yours holds for 8 is not better sounds. It is that something is always changing.

Practical techniques, cheapest first:

Mute and unmute. Drop the hats for two bars. Drop the bass for one bar before a change. Remove the kick for four bars in the middle of a section. This is free and it is what professionals do most.

Fills. The last bar of every 8-bar phrase should not be identical to the other seven. A tom fill, a reversed cymbal, a stutter on the vocal, a single extra kick.

Automation. Slowly move a filter cutoff, a reverb amount, a delay feedback across 16 bars. The listener will not identify what is changing but will feel that it is alive.

Layer entries. Introduce elements one at a time on phrase boundaries rather than all at once.

Two-bar and four-bar variants. Write your hat pattern as a four-bar loop with a difference in the fourth bar rather than a one-bar loop repeated.

The reliable rule: **something should change every 8 bars, and something big should change every 16.**

7.0.5 Transitions

Moving between sections needs a marker or it will feel like a bad edit.

A crash cymbal on the downbeat of the new section. A reverse cymbal leading into it. A short silence. A drum fill in the last bar. A quick filter sweep. A vocal one-shot. Any of these, and usually two of them together.

An **impact**, a low booming hit, on the downbeat of a drop is another standard tool and it is in FL's SFX pack.

7.0.6 Length, and why

Club tracks are 5 to 7 minutes. Radio and streaming edits are 3 to 4. Make the long version first. Cutting a long arrangement down is easy; extending a short one is not.

If you are only making tracks for yourself and for practice, 4 to 5 minutes is plenty and you will finish more of them.

7.0.7 How to arrange without going insane

Two approaches, and both work.

Top down. Build one perfect 8-bar loop with every element you want in the track. Then copy it across the whole timeline and start deleting things to create the intro, the breakdown and the build. Subtraction is much faster than addition, and it guarantees the sections are consistent.

This is the one to use as a beginner. It converts arranging from a creative problem into an editing problem.

Bottom up. Write the track linearly from bar 1. More natural, more likely to produce something that develops in an interesting way, and much more likely to stall at bar 40.

7.0.8 The finishing problem

You will make dozens of loops and finish none of them. Everyone does this. It has a name in producer forums, ”loop syndrome”, and the cure is procedural rather than creative:

Give yourself a deadline per track. One week, then it is done, then it goes in the ”finished” folder whether or not you like it.

Arrange before you mix. If you polish an eight-bar loop for six hours you will be sick of it before you ever arrange it.

Accept that the first 30 tracks are practice. They are not going to be good and they are not supposed to be. See `PRACTICE/8_week_plan.md`.

Chapter 8

Mixing, and enough about mastering

Mixing is making the parts audible together. It is the least glamorous part of production and the one that most obviously separates a demo from a record.

The good news for you specifically: Chicago house was mixed badly, on purpose and by accident, and it sounds fantastic. You do not need a professional mix to make good house. You need to not make the four or five mistakes that render a track unlistenable on a club system.

8.0.1 Gain staging

Before anything else. Every channel should be at a sensible level, with the master well below clipping.

Set your individual channels so the **master output peaks around -6 dBFS** with everything playing. Not -0.1. Digital clipping above 0 dBFS is ugly, and leaving headroom means the mastering stage has room to work.

If your master is clipping, turn things **down** rather than turning the master fader down. The relationship between the channels is what you are trying to control.

Set the kick first, at around -8 to -6 dBFS on its own channel, and balance everything else against it. The kick is the loudest thing in a house track and everything is measured relative to it.

8.0.2 The frequency map

There are only about 10 octaves of audible spectrum and every instrument is competing for them. Knowing roughly where things live is most of EQ.

Range	Name	What lives there
20 to 60 Hz	Sub	Felt more than heard. Kick fundamental, sub bass. Club systems reproduce this; laptop speakers do not
60 to 120 Hz	Bass	Kick body, bass fundamentals. The weight of the track
120 to 250 Hz	Low mid	Warmth. Also where things get boomy
250 to 500 Hz	Mud	Almost nothing needs boosting here. Cutting here cleans up a mix faster than anything else
500 Hz to 2 kHz	Mid	Body of most instruments. Vocals, chords, snare fundamentals
2 to 6 kHz	Presence	Attack, clarity, intelligibility. The ear is most sensitive here, so boosts get harsh fast

Range	Name	What lives there
6 to 12 kHz	Brightness	Hats, cymbals, sibilance, air on vocals
12 to 20 kHz	Air	Sparkle. Subtle

8.0.3 EQ, in three rules

Cut before you boost. If two things clash, remove frequencies from the less important one rather than boosting the more important one. Boosting adds energy and eats headroom.

Highpass almost everything. Every element except the kick and the bass should have a highpass filter removing energy below where that element actually lives. Hats at 300 to 500 Hz. Chords and pads at 150 to 300 Hz. Vocals at 80 to 120 Hz. Those rumbling low frequencies you cannot hear on your monitors are still consuming headroom and turning the club system to soup. This single habit is the biggest improvement available to a beginner mixer.

Carve, do not sculpt. A narrow cut at a specific problem frequency is surgical and useful. A broad boost across a whole region is usually a sign you picked the wrong sound.

To find a problem frequency: boost narrowly and sweep until the annoying thing gets much worse, then cut at that frequency instead.

FL Studio's tool for this is **Fruity Parametric EQ 2**, and it is genuinely good. There is nothing you need to buy.

8.0.4 The kick and bass problem

These two live in the same octave and this is the central mixing challenge of the genre.

Four solutions, and you will usually use two of them at once:

Separate them in frequency. Let the kick own 50 to 80 Hz and the bass own 80 to 200 Hz, or vice versa. Highpass the bass above the kick's fundamental.

Separate them in time. Put the bass on the offbeats so it never plays at the same instant as the kick. See `03_rhythm.md`. This is the classic disco and house answer and it is the easiest.

Sidechain compression. Covered below.

Tune the kick to the key. If your track is in A minor, tune the kick's fundamental to an A (55 Hz, or FL note A2). A kick whose pitch clashes with the bass note produces a dissonant beating you will hear as ”muddy” without knowing why. Pitch the sample up or down in the channel settings until it sits.

8.0.5 Sidechain compression, the house sound

You know the effect already: everything ducks down when the kick hits and swells back in between. That pumping is not a side effect. It is one of the most recognisable production choices in dance music, and it does two jobs at once.

Functionally, it clears space in the low end at the exact moments the kick needs it, so the kick punches through without the bass having to be quiet.

Musically, it creates rhythmic movement in sustained sounds. A pad that would otherwise sit still starts breathing in time with the track.

Apply it to the bass, the pads, and often the chords. Never to the kick itself.

Three ways to do it in FL Studio, easiest first:

Volume automation. Draw a repeating shape on the channel's volume that dips on each beat. Completely predictable, no routing, and you get exact control of the curve. Start here.

Fruity Limiter in COMP mode with the kick routed to its sidechain input. The standard method. Ratio around 4:1, fast attack, release tuned by ear so the sound recovers just before the next kick.

Fruity Peak Controller on the kick channel, linked to the volume of the target channel. Flexible, slightly more setup.

The amount matters. Deep house wants a subtle 2 to 3 dB of duck. Big-room and French house want it obvious and extreme. Chicago house from the 1980s has essentially none of it, because the technique came later.

8.0.6 Compression, generally

A compressor reduces dynamic range: it turns down the loud parts so you can turn the whole thing up.

Threshold is the level above which it starts working. **Ratio** is how hard it clamps (4:1 means 4 dB in produces 1 dB out above the threshold). **Attack** is how fast it reacts, and a slower attack lets the transient through, which keeps drums punchy. **Release** is how fast it recovers.

Uses in house: glue a drum bus together, control an inconsistent vocal, add sustain and punch to a bass, and sidechain.

The beginner error is compressing everything by default. If a sound is already consistent, a compressor does nothing except make it less lively. Use it when you can name the problem.

8.0.7 Reverb and delay, on sends

Do not put a separate reverb on every channel. It wastes CPU and, more importantly, it puts each element in a different acoustic space, which sounds incoherent.

Instead, set up one or two reverbs on **send tracks**, and route a little of each channel to them. Everything is then in the same room, and you control depth by how much you send.

A useful default: one short reverb (around 1 second) for drums and percussion, one long reverb (3 seconds or more) for pads and atmosphere.

Highpass the reverb return above 300 Hz. Low frequencies in a reverb are pure mud.

Keep the kick and bass dry. Almost always.

Delay set to a dotted 1/8 note (363 ms at 124 BPM) is the classic dance music echo. FL's **Fruity Delay 3** has tempo-synced presets.

8.0.8 Stereo

The rule that matters: **keep everything below about 150 Hz in mono.** Stereo bass causes phase problems, sounds unstable, and can partially cancel on a mono club system. FL's **Fruity Stereo Enhancer** has a ”separation” control that can do this, and Fruity Parametric EQ 2 can be set to affect only the sides.

Above that, spread things out. Pan percussion elements slightly left and right. Widen pads with chorus or a stereo delay. Keep the kick, bass, snare and lead vocal centred, because those are the anchors.

Check your mix in mono occasionally. If something disappears when you sum to mono, it has a phase problem.

8.0.9 Referencing

The most valuable habit in mixing, and it costs nothing.

Load a commercially released track you admire into your project on a separate channel. Level-match it to your track (turn the reference down, since it is mastered and much louder). Then A/B constantly while you mix.

> **Why this works.** You will immediately hear that your kick is too quiet, your hats are too loud, your bass has no weight, and your mix is muddier than theirs. Referencing converts a vague feeling into a specific comparison, which is why it beats any amount of theory.

Pick references from the same subgenre and the same era you are aiming at.

8.0.10 Loudness and what mastering is

Mastering is the final stage: making the track loud, consistent and translatable across systems. It is a real specialisation and people do it for a living.

What you need to know now:

LUFS is the standard loudness measurement, roughly matched to human perception. Streaming services normalise playback, so making your track brutally loud gains you nothing there. Spotify and YouTube normalise to about -14 LUFS integrated, Apple Music to about -16.

Club and DJ-oriented masters are usually louder, often -9 to -6 LUFS integrated, because they are competing against other records in a DJ's playlist rather than being normalised.

True peak should stay at or below -1 dBTP to avoid distortion when the file is converted to MP3 or AAC.

For your first year: put **Fruity Limiter** or **Maximus** on the master, pull the ceiling to -1 dB, push the gain until it is loud enough, and stop. Do not spend three hours on this. A well-arranged track at a modest volume beats a badly arranged track that is very loud.

8.0.11 Monitoring

You will mix on whatever you have, and that is fine, but know what your system lies about.

Laptop speakers reproduce almost nothing below 150 Hz, so you are mixing the low end blind. Consumer headphones usually exaggerate bass, so you will under-mix it. Neither is a disaster if you reference against commercial tracks on the same system.

Check on multiple systems: headphones, laptop, car, phone speaker. A mix that works everywhere is the goal, and phone speakers are a brutal but honest test of whether your groove survives without any bass at all.

Room acoustics matter more than speaker price, and a bedroom corner is the worst possible place to put a desk. If you get monitors later, that is the point to read about acoustic treatment.

Chapter 9

The genre map

Dance music genres are mostly distinguished by four things: tempo, kick pattern, swing, and sound palette. Once you can hear those four, you can identify almost anything, and the endless subgenre arguments become much less mysterious.

The two big families are **four on the floor** (a kick on every beat) and **broken beat** (a syncopated kick with a backbeat snare). Everything below belongs to one or the other.

9.0.1 Four on the floor

Genre	BPM	Tells	Start here
Disco	110 to 125	Live band, strings, real bass guitar, offbeat hats	Chic, Donna Summer
Chicago house	118 to 127	909 or 707 drums, raw, jack tracks, minimal chords	Marshall Jefferson, Phuture
Deep house	118 to 125	7th and 9th chords, soft kick, warm pads, jazzy	Larry Heard, Kerri Chandler, Moodymann
Acid house	118 to 130	TB-303 squelch and slide, high resonance	Phuture, Armando, 808 State
Garage (US)	120 to 128	Gospel vocals, swung, soulful, organ	Todd Terry, Masters at Work
French / filter house	120 to 128	Looped and filtered disco samples, heavy compression	Daft Punk, Stardust, Cassius
Nu-disco	115 to 125	Modern production, disco bass and chords	Todd Terje, Dimitri From Paris
Tech house	120 to 128	Techno drums with a house groove, minimal, dry	Green Velvet, Hot Since 82
Afro house	118 to 125	Live percussion, tribal patterns, chant vocals	Black Coffee
Progressive house	124 to 130	Very long builds, wide pads, melodic	Sasha, Eric Prydz
Big room / festival EDM	126 to 132	Enormous supersaw drops, minimal groove	Martin Garrix
Techno	125 to 150	Often no backbeat clap, industrial, hypnotic, dark	Jeff Mills, Robert Hood, Surgeon
Detroit techno	120 to 135	Melodic, futurist, string pads, funk underneath	Derrick May, Juan Atkins

Genre	BPM	Tells	Start here
Minimal techno	120 to 130	Almost nothing happening, very slowly	Richie Hawtin, Ricardo Villalobos
Trance	130 to 145	Supersaw leads, 16th-note bass, huge breakdowns	Paul van Dyk, Above & Beyond
Hardstyle / gabber	140 to 200	Distorted kick with a pitched tail	Various, at your own risk
Ghetto house	130 to 150	Bare 909, obscene chants, no chords	DJ Funk, DJ Deeon
Juke	155 to 165	Ghetto house sped up, chopped vocals	DJ Slugo, Traxman

9.0.2 Broken beat

Genre	BPM	Tells	Start here
Electro	120 to 135	808, syncopated kick, robotic, sci-fi	Drexciya, Kraftwerk
Breakbeat	125 to 140	Sampled funk breaks, no four-on-floor	The Chemical Brothers
UK garage / 2-step	130 to 140	Heavily swung, skipping kick, chopped vocals	MJ Cole, Artful Dodger
Grime	130 to 145	Sparse, aggressive, MC-led	Wiley, Dizzee Rascal
Dubstep	138 to 142	Half-time feel (snare on 3), heavy sub, wobble bass	Mala, Skream
Footwork	155 to 165	Triplet kicks, extreme repetition, huge space	RP Boo, DJ Rashad
Jungle	160 to 175	Chopped Amen break, reggae basslines	Goldie, Dillinja
Drum and bass	170 to 176	Two-step break, sub bass, dark or liquid	LTJ Bukem, Noisia

Note the gap between about 145 and 155 BPM. Very little lives there, because those tempos are physically awkward: too fast to dance to at full speed, too slow to feel half-time.

Note also that dubstep at 140 BPM and drum and bass at 175 both feel slow, because their snare pattern implies a half-time or double-time reading. Tempo alone does not determine perceived speed.

9.0.3 The Chicago family tree

Everything below came from within about ten miles of where you live.

```
Disco (1970s)
    |
The Warehouse, Frankie Knuckles (1977 to 1982)
    |
Chicago house (1984)
    |-- Deep house ------> Larry Heard, then everywhere
    |-- Acid house ------> UK rave, then trance and techno
```

```
    |-- Jack tracks -----> Ghetto house -----> Juke -----> Footwork
    |-- Hip house -------> a dead end, mostly
    |
(exported to New York, London, Ibiza, Berlin)
    |
Everything else with a four-on-the-floor kick
```

Detroit techno developed in parallel about 280 miles away and the two scenes fed each other constantly. House is warmer and more soulful; techno is colder and more futurist. That is the entire distinction, and it dissolves the moment you look at any specific record.

9.0.4 Which one should you make?

Start with **Chicago house or deep house**, for four reasons.

The tempo is forgiving. At 122 BPM you have time to hear what you are doing.

The arrangements are simple. A deep house track is a groove, two chords and a bassline. There is nowhere for production weakness to hide, but there is also very little to learn before you can make a complete one.

The production standard is achievable. Nobody expects a deep house record to sound like a mastered festival single. Warmth and groove beat polish.

And it is the local tradition, which is what you said you wanted.

> **Watch out.** Avoid starting with trance, big-room or drum and bass. All three demand a level of technical production skill that will make your first six months miserable.

Chapter 10

Glossary

Every term you are likely to hear, in one line each. Grouped by area rather than alphabetised, because you will be looking things up by context.

10.0.1 Rhythm and timing

BPM Beats per minute. The tempo.

Bar One cycle of the meter. Four beats in almost all dance music.

Beat One quarter note. In house, one kick drum.

Step One sixteenth note. A drum machine bar has sixteen of them.

Downbeat Beat 1 of a bar.

Offbeat / upbeat The "&" halfway between two beats. Where house hi-hats and basslines live.

Backbeat Beats 2 and 4. Where the clap or snare goes.

Four on the floor A kick drum on every beat.

Two-step A broken kick pattern, characteristic of UK garage.

Half-time A pattern that implies half the tempo, usually by putting the snare on beat 3 instead of on 2 and 4.

Swing / shuffle Delaying every second subdivision to create a lopsided groove. 50% is straight, 66.7% is a full triplet feel.

Quantise Snapping notes to the nearest grid position.

Groove / feel The overall rhythmic character, including swing, velocity and micro-timing.

Syncopation Accents placed where the meter does not expect them.

Polyrhythm Two rhythmic cycles of different lengths running at once.

Ghost note A deliberately quiet hit between the accented ones.

Velocity How hard a note is played, 0 to 127. Usually maps to volume and brightness.

Phrase A group of bars, usually 4, 8, 16 or 32, forming one unit of the arrangement.

10.0.2 Arrangement

Intro The opening section, usually drums only, designed for the DJ to mix into.

Outro The closing section, same idea in reverse.

Breakdown A section where the drums drop out and the atmosphere takes over.

Build / riser section The tension-increasing section before a drop.

Drop The moment everything returns at full force. The payoff.

Riser A rising noise or tone used to build tension.

Impact A low booming hit marking a drop.

Fill A short variation at the end of a phrase that signals a change is coming.

Loop A repeating section of music.

Loop syndrome The chronic condition of making dozens of loops and finishing no tracks.

Stem A submix of one group of elements (all drums, all vocals) exported separately.

Edit / rework / VIP Versions of a track: a DJ edit for mixing, a rework by someone else, a VIP as the producer's own alternate version.

Dub / instrumental A version with the vocal removed or heavily reduced.

Extended mix The full-length club version, as opposed to the radio edit.

10.0.3 Harmony

Semitone The smallest step in Western music. A ratio of 2^(1/12).

Interval The distance between two notes, measured in semitones.

Scale The set of notes a piece stays inside.

Key A scale plus a home note.

Root The note a chord is built on.

Triad A three-note chord.

Seventh / ninth chord A chord with a fourth or fifth note stacked on, giving the jazzy, unresolved quality house is built on.

Inversion The same chord with a different note at the bottom.

Voicing The specific arrangement and spacing of a chord's notes.

Voice leading Moving between chords by shifting each note as little as possible.

Progression A sequence of chords.

Vamp A short progression, often just two chords, repeated indefinitely.

Roman numerals Key-independent shorthand for chords: i, iv, V and so on.

Relative minor The minor key sharing the same notes as a given major key.

Pentatonic A five-note scale in which nothing sounds wrong.

Monophonic / polyphonic One note at a time versus several. Basses should be monophonic.

Camelot wheel A relabelling of the circle of fifths used by DJs for harmonic mixing.

10.0.4 Synthesis

Oscillator The part that generates the raw tone.

Waveform The oscillator's shape: sine, triangle, square, sawtooth, noise.

Subtractive synthesis Starting with a rich waveform and filtering harmonics away. The dominant method.

Additive synthesis Building a sound by summing individual sine partials.

FM synthesis Using one oscillator to modulate another's frequency at audio rate.

Wavetable synthesis Scanning through stored waveforms so the timbre morphs over time.

Filter Removes frequencies above or below a cutoff.

Cutoff The filter's corner frequency.

Resonance A boost right at the cutoff. High resonance is the acid sound.

Slope How steeply a filter cuts, in dB per octave. 12, 18 and 24 are common.

Envelope / ADSR Attack, Decay, Sustain, Release. How a parameter changes over one note. Sustain is a level; the other three are times.

LFO A low frequency oscillator used as a controller rather than a sound source.

Modulation Any parameter controlling another parameter.

Portamento / glide / slide Sliding continuously from one pitch to the next.

Unison / detune Stacking several slightly out-of-tune copies of an oscillator for thickness. The super-saw.

Patch / preset A saved synth setting.

Polyphony How many notes a synth can play at once.

10.0.5 Sampling

One-shot A single sound, triggered whole.

Sample pack A commercial collection of one-shots and loops.

Chop Cutting a sample into pieces and resequencing them.

Slicing Automatically dividing a loop at its transients.

Time stretch Changing length without changing pitch.

Pitch shift Changing pitch without changing length.

Vocal chop A short vocal fragment played as an instrument.

Break A drum-only section of an old record, sampled. The Amen break is the famous one.

Clearance Legal permission to use a sample from a copyrighted recording.

Royalty free Sample material licensed for use in your own productions.

10.0.6 Mixing and mastering

Gain staging Setting sensible levels through the whole signal chain.

dBFS Decibels relative to full scale. 0 dBFS is the digital ceiling.

Headroom How much space is left before clipping.

Clipping Exceeding the ceiling, producing distortion.

EQ Equalisation. Boosting or cutting specific frequency ranges.

Highpass / lowpass Filters removing lows or highs respectively.

Compression Reducing dynamic range so the whole thing can be louder.

Threshold, ratio, attack, release The four main compressor controls.

Sidechain Using one signal to control a processor on another. Usually the kick ducking the bass.
Limiter A compressor with a very high ratio, used to catch peaks.
Send / return / bus Routing a copy of several channels to a shared effect.
Dry / wet Unprocessed versus processed signal.
Pan Position in the stereo field.
Mono compatibility Whether the mix survives being summed to a single channel.
Phase The relative timing of waveforms. Misaligned phase causes cancellation.
LUFS The standard perceptual loudness measurement.
True peak (dBTP) Peak level accounting for what happens between samples. Keep at or below -1.
Loudness war The long-running trend of mastering everything as loud as possible.
Mastering The final polishing and loudness stage.
Reference track A commercial release you A/B against while mixing.

10.0.7 Software and hardware

DAW Digital audio workstation. FL Studio, Ableton Live, Logic, Bitwig.
Plugin Software instrument or effect loaded inside a DAW.
VST / AU / CLAP Plugin formats. VST is the Windows standard.
MIDI A protocol for note and control data. Not audio.
Piano roll The grid editor where MIDI notes are drawn.
Step sequencer A grid of on/off buttons for programming drums.
Automation Recorded parameter changes over time.
ASIO The low-latency Windows audio driver standard. Required for usable performance.
Buffer size How much audio is processed at once. Smaller means lower latency and higher CPU load.
Latency The delay between an action and hearing the result.
Bounce / render / export Writing the project out as an audio file.
Freeze Rendering a track to audio temporarily to save CPU.
Controller A hardware device sending MIDI to your DAW.
Audio interface External hardware for converting audio in and out of the computer.

10.0.8 Machines you will hear named

TR-909 Roland drum machine, 1983. The house and techno standard.
TR-808 Roland drum machine, 1980. Deep booming kick, cowbell. Hip-hop and electro.
TR-707 Roland drum machine, 1985. Cheaper, drier, all over early Chicago records.
TB-303 Roland bass synth, 1981. A commercial failure that invented acid house.
Juno-60 / Juno-106 Roland polysynths with a famous chorus. The deep house pad sound.
SP-1200 / MPC Samplers. The foundation of hip-hop and a lot of house.
Technics SL-1200 The DJ turntable.
CDJ Pioneer's standard club media player.

10.0.9 Scene and culture

House The genre, named after the Warehouse in Chicago.

Jack To dance to house. Also a jack track: a stripped, hypnotic, drum-led record.

Resident A DJ with a regular slot at one club.

Set A DJ's performance.

Beatmatching Aligning the tempo and phase of two records.

Mixing in key Selecting records with compatible keys.

Warm-up The early part of the night, played slower and deeper. A specialised skill.

Peak time The busiest, hardest part of the night.

White label / promo A limited pressing without full artwork, usually for DJs.

Crate digging Searching for records in shops.

Rave An event, historically illegal or unlicensed.

Bootleg / mashup An unofficial edit combining or reworking existing records.

Four to the floor See four on the floor. Same thing, said differently, by everyone.

Part II

FL Studio

Chapter 11

Setup: the first twenty minutes

Written against what is actually installed on this machine: **FL Studio 2025, version 25.1.4**, with the All Plugins bundle. Every path and shortcut below has been checked against your install and against Image-Line's official shortcut reference rather than recalled from memory.

You already opened FL once, on 8 May, and worked for about two hours before stopping. Worth knowing that those projects are still there under `Documents\Image-Line\FL Studio\Projects` if you want to look at what past-you was doing.

11.0.1 1. Audio settings, before anything else

If the audio is misconfigured, everything you play will be late, crackly, or silent, and you will conclude that you are bad at this rather than that a dropdown is wrong.

Press **F10** to open Settings, then click the **Audio** tab.

Set **Device** to **FL Studio ASIO**. It is already installed on this machine. ASIO is the low-latency Windows audio driver standard, and the generic Windows driver will give you audible delay between pressing a key and hearing a note. FL Studio ASIO has the useful property of letting other applications keep using your sound card at the same time, so you can have a YouTube tutorial open while FL is running.

If you later buy an audio interface, use its own ASIO driver instead.

Click **Show ASIO panel** and set the buffer to **512 samples**, which is about 11 ms of latency. If you get crackling, go up to 1024. If you are playing an instrument in and it feels sluggish, go down to 256.

Set the sample rate to **44100 Hz**. There are arguments for 48 kHz. None of them will matter to you for a year.

11.0.2 2. Project settings

Tempo. The number in the top toolbar. Right-click it and choose **Type in value**, then enter **124**. That is the middle of the house range and a good default.

Save your project immediately with Ctrl+S, and give it a real name. FL autosaves, but it autosaves into files called "untitled (autosaved at 21h49)", which is how you end up with the folder you currently have.

A warning about a shortcut that will surprise you: in FL Studio **Ctrl+N is not "new file"**. It is "save new version", which increments your filename. Use **File > New** from the menu instead.

11.0.3 3. Make a starter template

You will do the same setup at the start of every project. Do it once.

Build a project containing:

- Tempo at 124
- Four drum channels loaded (kick, clap, closed hat, open hat) and routed to their own mixer tracks
- A Fruity Limiter on the master with the ceiling at -1 dB
- Two mixer tracks set up as reverb sends, one short and one long

Then save it into:

```
C:\Users\compl\Documents\Image-Line\FL Studio\Projects\Templates\
```

That folder exists and is currently empty. Anything you save there appears under **File > New from template**. Call it something like `house_124.flp`.

This is a bigger time-saver than it looks. Removing twenty minutes of setup friction is the difference between opening FL when you have a spare hour and not bothering.

11.0.4 4. Where your files live

What	Where
The program	`C:\Program Files\Image-Line\FL Studio 2025`
Bundled samples	`...\FL Studio 2025\Data\Patches\Packs` (shown as **Packs** in the browser)
Your projects	`C:\Users\compl\Documents\Image-Line\FL Studio\Projects`
Your templates	`...\FL Studio\Projects\Templates`
Rendered audio	`...\FL Studio\Audio` by default

Worth adding your own sample folder to the browser at some point: **Settings (F10) > File**, then point one of the extra search folders at wherever you keep downloaded packs. They then show up in the browser alongside the bundled ones.

11.0.5 5. Turn on two things that will save you

Options > Undo history is not enabled by default in a useful depth. Set the undo levels higher in Settings > General.

The metronome is Ctrl+M. You will not need it for step-sequenced drums, but you will the moment you try to play anything in.

11.0.6 6. A note on editions

FL Studio comes in Fruity, Producer, Signature and All Plugins editions. Your install has the All Plugins generator set: Sytrus, Harmor, Morphine, Ogun, Toxic Biohazard, Transistor Bass, Kepler, Drumaxx, Slicex, DirectWave and the rest are all present.

That means every tutorial you find online will work for you, and you never need to buy a plugin to follow along. It also means you have about forty synthesisers and will be tempted to try all of them. Do not. `05_plugins.md` lists the six that matter.

11.0.7 Next

`01_interface.md` to learn the windows, or skip straight to `02_first_beat.md` and make noise. Making noise first is the better order.

Chapter 12

The interface

FL Studio has a reputation for being confusing, and the reason is that it works differently from every other DAW in one specific way. Once you understand that difference the rest is just windows.

12.0.1 The one idea that makes FL make sense

In most DAWs, a track is a lane that contains both an instrument and its notes. Ableton, Logic and Pro Tools all work this way.

FL Studio splits these apart:

- A **Channel** is an instrument or a sample. It lives in the Channel Rack.
- A **Pattern** is a container of note data. It can hold notes for *any number of channels at once*.
- The **Playlist** is where you place pattern clips on a timeline.
- A **Mixer track** is a destination for audio, where effects live. It is a separate numbering system from channels, and channels have to be routed to it manually.

So one pattern might contain the kick, clap and hats together. You then drop that single pattern clip onto the playlist wherever you want drums.

This is genuinely more flexible than the alternative and genuinely more confusing at first.

The catch. Patterns are global. Which playlist lane you drop a pattern into makes no difference to what it sounds like. The lanes are purely visual organisation, and treating them as tracks is the first mistake everyone coming from Ableton makes.

12.0.2 The five windows

Window	Key	What it is for
Channel Rack	F6	Your list of instruments, plus the step sequencer for drums
Piano Roll	F7	Drawing notes for one channel
Playlist	F5	Arranging the whole track on a timeline
Mixer	F9	Levels, effects, routing
Browser	Alt+F8	Samples, presets, plugins, project contents

F12 closes all of them at once, which is the fastest way out of a mess.

Channel Rack (F6)

A vertical list of channels. Each row has, from left to right: a green LED for mute, a pan and volume knob, the channel's name button, and then sixteen **step buttons**.

Left-click a step to turn it on, right-click to turn it off. Those sixteen buttons are one bar divided into sixteenth notes, exactly the grid described in `THEORY/03_rhythm.md`.

Clicking a channel's **name button** opens its settings and the plugin's interface.

At the bottom is a **+** button to add a new channel. At the top-left is a **graph editor** toggle (a small bar-chart icon) which reveals a velocity lane for the selected channel. Use it constantly on hi-hats.

There is a **swing** knob on the Channel Rack toolbar. It applies to the step sequencer. Somewhere between 15% and 25% is a good house shuffle.

The step sequencer only shows one pattern at a time. Which one is set by the pattern selector in the main toolbar.

Piano Roll (F7)

For anything that is not a simple drum pattern. Select a channel and press F7, or right-click the channel name and choose **Piano roll**.

Notes are drawn left to right over time, bottom to top in pitch. Left-click with the pencil to draw, right-click to delete, drag the right edge of a note to change its length.

Remember from `THEORY/04_harmony.md` that **FL labels middle C as C5**, one octave number higher than most other software.

Two features worth finding early. The **scale highlighting** option (in the piano roll's options menu, under "Helpers") greys out the notes that are not in your chosen key, which makes it very hard to play a wrong note. And the **stamp** tool in the piano roll toolbar drops in ready-made chord shapes, including the seventh and ninth chords house is built on.

Playlist (F5)

The timeline. Horizontal lanes hold **pattern clips**, **audio clips** and **automation clips**.

Select a pattern in the toolbar, pick the paint tool, and click in a lane to place it. Drag its edge to extend it. Ctrl+B duplicates whatever is selected to the right, which is how you build 32 bars quickly.

Set up your lanes with a consistent layout: drums on lane 1, bass on 2, chords on 3, and so on. It is only cosmetic but it stops you losing things at bar 90.

Mixer (F9)

The Master track on the left, then numbered **Insert** tracks. Each has a fader, a pan control, and eight **effect slots** on the right-hand panel.

> **Watch out.** Routing is manual. A new channel goes to the master by default, which means you cannot EQ it separately. Select the channels in the Channel Rack and press **Ctrl+L**, which routes each one to its own free mixer track. This is the single most useful shortcut in FL Studio and almost nobody finds it on their own.

At the bottom of each mixer track are small **send arrows** that route audio to other tracks. That is how you build reverb sends and how you set up sidechain compression.

Browser (Alt+F8)

The docked panel on the left. Its most useful folder for you is **Packs**, which is the bundled sample library:

```
Packs
  Drums          Kicks, Hats, Snares, Percussion, Cymbals, Toms, Kits
  Drums (ModeAudio)
  Instruments    Bass, Guitar, Keyboard, Orchestral
  Legacy         the older FL sample library
  Loops
  Risers         build-up sweeps
  SFX            impacts and noise
  Shapes         automation curve presets
  Vocals
  FLEX           presets for the FLEX synth
```

You can drag anything from the browser straight onto the Channel Rack or the playlist. Single-clicking a sample previews it.

12.0.3 Pattern mode versus Song mode

The toolbar has a **PAT / SONG** switch, and **L** toggles it.

Pattern mode loops the currently selected pattern. This is where you work on a groove.

Song mode plays the playlist from the timeline. This is where you arrange.

If you press play and hear only drums when your project has chords, you are almost certainly in Pattern mode with the drum pattern selected. This is the most common confusion in the entire program.

12.0.4 Transport and patterns

Space starts and stops. **Ctrl+Space** pauses instead of returning to the start.

F4 creates the next empty pattern and asks you to name it. Name your patterns. A project with ”Pattern 1” through ”Pattern 23” is unusable by the time you are arranging.

F2 renames the selected pattern.

Ctrl+H is panic, and stops all sound. Useful when something gets stuck.

12.0.5 Tools

In the Playlist and Piano Roll, the toolbar has a set of tools with single-key shortcuts:

P draw (pencil), **B** paint (brush, for repeated placement), **D** delete, **E** select, **Z** zoom, **C** slice, **T** mute, **Y** playback, and **S** for slip edit in the playlist.

Hold **Alt** while dragging to bypass snapping, which you will need constantly for fine-tuning timing.

12.0.6 What to ignore for now

FL has a great deal you do not need yet: Patcher, the piano roll's arpeggiator and Riff Machine, Gross Beat, Edison, the video player, ReWire, performance mode, and about thirty of the synths.

None of it is wasted, but exploring it is not learning. Ignore it until you have finished three tracks.

Chapter 13

Your first house beat, in twenty minutes

No theory required. Follow the steps, and read `THEORY/03_rhythm.md` afterwards to find out what you just did.

Everything here uses samples that are already on your machine. Nothing to download.

13.0.1 Setup

1. **File > New**. Remember that Ctrl+N is ”save new version” in FL, not ”new file”.
2. Right-click the tempo readout in the top toolbar, choose **Type in value**, enter **124**.
3. Press **F6** to open the Channel Rack. If it already has channels loaded, right-click each name and choose **Delete** to clear it out.
4. Make sure you are in **Pattern mode**. The toolbar shows PAT or SONG, and **L** toggles it.

13.0.2 Load four sounds

Open the Browser on the left (**Alt+F8** if it is hidden) and navigate to **Packs > Drums**.

Drag each of these onto an empty slot in the Channel Rack:

Sound	Browser location
Kick	`Packs > Drums > Kicks > 909 Kick`
Clap	`Packs > Drums > Percussion > 909 Clap`
Open hat	`Packs > Drums > Hats > 909 OH`
Closed hat	`Packs > Drums > Hats > 909 CH 1`

These are samples of the Roland TR-909, the drum machine that Chicago house and techno were built on. Single-clicking a sample in the browser previews it, so you can hear them before you commit.

13.0.3 Program the pattern

Each channel has sixteen step buttons. They are one bar, divided into sixteenth notes. Left-click to turn a step on, right-click to turn it off.

Turn on these steps:

```
Step    1   2   3   4   5   6   7   8   9  10  11  12  13  14  15  16
Count   1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
```

```
909 Kick    X   .   .   .   X   .   .   .   X   .   .   .   X   .   .   .
909 Clap    .   .   .   .   X   .   .   .   .   .   .   .   X   .   .   .
909 OH      .   .   X   .   .   .   X   .   .   .   X   .   .   .   X   .
909 CH 1    X   X   .   X   X   X   .   X   X   X   .   X   X   X   .   X
```

Press **Space**.

That is a house beat. Kick on every beat, clap on 2 and 4, open hi-hat on every offbeat, closed hats filling the rest.

Build it one channel at a time and listen after each. In particular, program the kick alone, then add the open hat, and notice how much the open hat does. It is the element that makes the loop move rather than just plod.

13.0.4 Make it feel human

Two adjustments, both of which matter more than they sound like they should.

Swing. Find the swing knob on the Channel Rack toolbar and turn it up to somewhere between 15% and 25%. This delays every second sixteenth slightly. The pattern stops sounding like a machine and starts sounding like a groove. Turn it back to zero and compare.

Velocity. Select the closed hat channel, then click the **graph editor** button at the top-left of the Channel Rack (the small bar-chart icon). You now see a bar for each step. Drag them so the hats alternate loud and quiet, or so that every fourth one is loudest.

Real drummers do not hit every note identically. Programmed hats at uniform velocity are the clearest giveaway of an amateur track, and this takes thirty seconds to fix.

13.0.5 Route to the mixer

Right now every channel goes straight to the master, which means you cannot process them separately.

Select all the channels in the Channel Rack (Ctrl+A works, or click the first channel button and Ctrl+click the others), then press **Ctrl+L**. Each channel is assigned to its own free mixer track.

Press **F9** to open the Mixer and confirm you now have four labelled tracks.

This is the most useful shortcut in FL Studio and it is very hard to discover on your own.

13.0.6 Balance it

In the mixer, set rough levels. The kick should be the loudest thing. A starting point:

- Kick: leave at 0 dB, and check the master is peaking around -6 dB
- Clap: 3 to 6 dB below the kick
- Closed hat: quiet, 10 to 15 dB below the kick
- Open hat: slightly louder than the closed hat

Then add **Fruity Parametric EQ 2** to both hat channels and highpass them at around 400 Hz. Hats have no useful information down low, and removing it cleans up the whole mix. Do the same to the clap at around 200 Hz.

13.0.7 Now make it yours

The four-line pattern above is correct and generic. Everything interesting comes from what you add to it. Try these one at a time:

A shaker or tambourine on sixteenths. `Packs > Drums > Percussion > 707 Tamb`. Set it quiet, and use the graph editor so it pulses.

A rimshot on the "a" of beat 4 (step 16). `Packs > Drums > Snares > 909 Rim`. One extra hit at the end of the bar makes the loop turn over instead of just repeating.

An 808 cowbell somewhere unexpected. `Packs > Drums > Percussion > 808 Cowbell`. Almost comically effective in house.

A second kick sample layered underneath for weight, or an 808 kick with its decay shortened.

Drop the closed hats for two bars. You will need to extend the pattern length first (the pattern length control is at the top of the Channel Rack, set it to 2 bars and you get 32 steps).

Take the kick out entirely for four bars and hear what happens when it comes back.

13.0.8 Save

Ctrl+S, and give it a real name. Not "untitled".

13.0.9 What you have

> **What you have.** A loop, not a track. Twelve to sixteen hits, four samples, one bar. Turning it into a track is `03_first_track.md`, and it is a different and harder skill.

Before you go there, spend some time on this loop. Try to rebuild the drum pattern of a Chicago house record by ear, using only these four sounds. Put on Marshall Jefferson's "Move Your Body" or anything from `LISTENING/chicago_canon.md`, and copy what you hear. That single exercise teaches more than any tutorial.

Chapter 14

From loop to finished track

Continues from `02_first_beat.md`. By the end you will have an exported MP3. It will not be good. That is not the point of the exercise.

Budget two to three hours. Do it in one sitting if you can, because the failure mode is stopping halfway.

We are in **A minor** at **124 BPM**. Everything below uses FL Studio's note naming, in which middle C is labelled **C5**.

14.0.1 1. Organise your patterns first

You will end up with several patterns, and naming them now saves real pain later.

Press **F4** to create a new named pattern. Make these:

- `DRUMS` (the one you already made)
- `DRUMS MINIMAL` (kick and hats only, for the intro)
- `BASS`
- `CHORDS`

F2 renames the currently selected pattern if you need to fix one.

14.0.2 2. The chords

Add a channel: click the **+** at the bottom of the Channel Rack and choose **FL Keys**. It is FL's electric piano, and a Rhodes-type sound is the correct instrument for deep house.

Select the CHORDS pattern, select the FL Keys channel, press **F7** for the piano roll.

Set the pattern length to 2 bars, then draw two chords, one per bar:

Bar	Chord	Notes (FL naming)
1	A minor 7	A4, C5, E5, G5
2	D minor 7	A4, C5, D5, F5

Draw each chord as four notes stacked vertically, each lasting a full bar.

Why this works. A4 and C5 stay exactly where they are. E5 moves down to D5, and G5 moves down to F5. Two notes move, by one step each. That is voice leading, and it is why this sounds smooth instead of blocky. The lazy version (A-C-E-G then D-F-A-C, everything jumping) sounds noticeably worse. Play both.

Both chords are minor sevenths rather than plain triads, which is what gives house its warm, unresolved, loops-forever quality. See `THEORY/04_harmony.md`.

Making it sound like house rather than like a piano

Right now it is a sustained chord, which is fine for a pad but dull as the main hook. Two options:

The stab. Shorten every note to a sixteenth and move them onto the offbeats (steps 3, 7, 11, 15). Now the chord punches between the kicks. This is the Chicago sound.

The pad. Leave them long, add **Fruity Reeverb 2** to the channel, and turn the mix up to about 30%. Now it is atmosphere.

Do both, on two separate channels, and use the stab in the busy sections and the pad in the breakdown.

14.0.3 3. The bass

Add another channel. Two good options on your install:

FLEX with a bass preset, which is the easy route.

Transistor Bass, which is FL's Roland TB-303 emulation, and is the historically correct choice. If you want acid, this is the instrument. Turn the resonance up high and sweep the cutoff while it plays.

Select the BASS pattern and open the piano roll. Set the length to 2 bars.

Play the root of whatever chord is above it, on the offbeats, so the bass never collides with the kick:

```
Count   1   e   &   a   2   e   &   a   3   e   &   a   4   e   &   a
Kick    X   .   .   .   X   .   .   .   X   .   .   .   X   .   .   .
Bass    .   .   X   .   .   .   X   .   .   .   X   .   .   .   X   .
```

Bar 1 plays **A2** (55 Hz). Bar 2 plays **D3** (73 Hz).

That is the entire disco and house bass tradition in one pattern, and it solves a mixing problem for free: because the bass never sounds at the same instant as the kick, they cannot fight each other.

Once that works, try the octave bounce. Alternate A2 and A3 instead of repeating A2. It immediately has more movement.

Make sure the bass is **monophonic**, one note at a time. Chords in the bass register turn to mud.

14.0.4 4. Route everything and set levels

Select all channels, press **Ctrl+L**, open the mixer with **F9**.

Highpass the chords at around 200 Hz with **Fruity Parametric EQ 2**. They do not need low end, and removing it gives the bass room.

Set the kick as the loudest element and balance everything against it. Aim for the master peaking around **−6 dB** with everything playing.

14.0.5 5. Sidechain the bass to the kick

This is the pumping effect, and it is what makes the low end work.

1. In the Mixer, select the **kick's** track.
2. Look at the small send arrows at the bottom of the mixer tracks. Right-click the arrow underneath the **bass's** track and choose **Sidechain to this track**.
3. Select the bass's track. Add **Fruity Limiter** to an effect slot.
4. In Fruity Limiter, switch to the **COMP** tab.
5. Set the **SIDECHAIN** knob to the sidechain number you just created (it will be 1 if this is your first).
6. Set the ratio to about 4:1, threshold down until you see 3 to 6 dB of gain reduction on each kick, attack fast, and release tuned so the bass recovers just before the next kick.

If you hear the kick doubling through the bass channel, turn that send's level knob to zero. You want the kick's signal used as a trigger, not mixed in.

Do the same for the pad. Not for the kick itself.

If this feels like too much routing for now, the simpler alternative: right-click the bass channel's volume knob, choose **Create automation clip**, and draw a shape that dips on every beat. Less elegant, entirely functional, and you get exact control of the curve.

14.0.6 6. Arrange it

Switch to **Song mode** (press **L**) and open the Playlist (**F5**).

Place pattern clips using the paint tool. Here is a 128-bar arrangement, which runs about 4 minutes 8 seconds at 124 BPM. Copy it directly:

Bars	DRUMS MINIMAL	DRUMS	BASS	CHORDS (stab)	CHORDS (pad)
1 to 16	yes				
17 to 32	yes		yes		
33 to 64		yes	yes	yes	
65 to 80					yes
81 to 96	yes				yes
97 to 128		yes	yes	yes	yes

Bars 65 to 80 are the breakdown: the drums stop, the pad carries it. Bars 81 to 96 are the build. Bar 97 is the drop, and it is the loudest moment in the track.

Ctrl+B duplicates a selection to the right, which is how you fill 32 bars without a hundred clicks.

Notice every section boundary is on a multiple of 16 bars. This is not optional. See `THEORY/06_arrangement.md`.

14.0.7 7. Make the build build

At the moment bars 81 to 96 are just quieter. Add tension:

A riser. Drag something from `Packs > Risers` onto the playlist so it ends exactly on bar 97.

A filter opening. Right-click the cutoff knob on the pad's filter, create an automation clip, and draw it rising across those 16 bars.

A hat roll. Make a new pattern with closed hats every 1/8 for four bars, then 1/16 for four, then 1/32 for the last two.

Silence. Delete everything from the last half bar before the drop. This is the single most effective trick available and it is free.

A crash on bar 97. `Packs > Drums > Cymbals`. Marks the boundary.

14.0.8 8. Master, lightly

Select the Master track in the mixer. Add **Fruity Limiter**. Set the ceiling to $-$**1 dB** and push the gain until it is comfortably loud.

That is enough. Do not spend three hours here. A well-arranged track at moderate loudness beats a badly arranged one that is very loud.

14.0.9 9. Export

First make sure the playlist knows how long the song is. If you have a time selection active FL will export only that, so click in an empty part of the timeline to clear it.

Ctrl+R exports a WAV. **Ctrl+Shift+R** exports an MP3.

For sharing, MP3 at 320 kbps. For archiving or sending to anyone who will work on it further, WAV at 24-bit.

In the export dialog, set the **Tail** option to **Leave remainder** so your reverb tails do not get chopped off at the end.

14.0.10 10. Then listen to it somewhere else

Put it on your phone. Play it in the car. Play it on a bluetooth speaker.

It will sound different and worse, and the specific ways it sounds worse are your next lesson. Write them down.

14.0.11 What to expect

Your first track will have most of these problems: the mix is muddy, the arrangement is repetitive, the drums are stiff, and it does not sound like the records you like. All of that is normal and none of it is a reason to stop.

You have now done the whole loop once, from empty project to exported file. That is the thing most people never get to. Everything from here is refinement.

`PRACTICE/8_week_plan.md` for what to do next.

Chapter 15

Keyboard shortcuts

Checked against Image-Line's official shortcut reference, not from memory. These are for FL Studio on Windows.

Print this, or keep it open on a second monitor for the first month.

15.0.1 Windows

Key	Action
F5	Playlist
F6	Channel Rack / Step Sequencer
F7	Piano Roll
F8	Plugin Picker
F9	Mixer
F10	Settings (audio, MIDI, general, file)
F11	Song info
F12	Close all windows
Alt+F8	Sample Browser
F1	Help

15.0.2 Transport

Key	Action
Space	Play / stop
Ctrl+Space	Play / pause (does not return to start)
L	Toggle Pattern / Song mode
R	Toggle recording
Ctrl+M	Metronome
Ctrl+P	Recording count-in
Ctrl+H	Panic, stop all sound

15.0.3 Patterns

Key	Action
F4	Create next empty pattern, with naming dialog
F2	Rename the selected pattern

15.0.4 Files

Key	Action
Ctrl+S	Save
Ctrl+Shift+S	Save as
Ctrl+N	**Save new version.** Not ”new file”
Ctrl+R	Export WAV
Ctrl+Shift+R	Export MP3
Ctrl+Shift+M	Export MIDI

The Ctrl+N behaviour is the one that catches everyone coming from other software. Use **File > New** from the menu.

15.0.5 Routing

Key	Action
Ctrl+L	Route selected channels to free mixer tracks

The most useful shortcut in the program. Select your channels in the Channel Rack, press it, and every one gets its own mixer track ready for EQ and effects.

15.0.6 Tools (Playlist and Piano Roll)

Key	Tool
P	Draw (pencil)
B	Paint (brush)
D	Delete
E	Select
Z	Zoom
C	Slice
T	Mute
Y	Playback
S	Slip edit (Playlist only)

15.0.7 Editing

Key	Action
Ctrl+B	Duplicate selection to the right
Ctrl+C / Ctrl+V / Ctrl+X	Copy / paste / cut

Key	Action
Shift+left-click and drag	Clone a clip or pattern
Alt (held while dragging)	Bypass snapping
Alt+Q	Quantize (Piano Roll)

Ctrl+B is how you turn an 8-bar section into 32 bars in three keystrokes. Learn it early.

15.0.8 Mouse conventions worth knowing

FL uses the right mouse button far more than other software.

Right-click a knob for a menu with ”Type in value”, ”Create automation clip”, ”Link to controller”, and ”Reset”. This is how most automation gets made.

Right-click a step in the step sequencer to turn it off.

Right-click a note in the piano roll to delete it.

Right-click a channel name for options including Piano roll, Rename, Colour, and Delete.

Middle-click and drag, or hold the right mouse button in empty space, to pan around the playlist.

Scroll wheel over a knob adjusts it in fine increments. Ctrl+scroll is finer still.

15.0.9 The three you will use most

If you remember nothing else from this file:

Ctrl+L to route to the mixer. **Ctrl+B** to duplicate. **F4** to make a named pattern.

Chapter 16

Which plugins actually matter

Your install has roughly 48 instruments and 85 effects. This is a problem, not a feature. Plugin browsing feels like work and is not work.

Here is the short list. Everything below is confirmed present on this machine.

16.0.1 The six instruments to learn

FLEX. Preset-driven, covers a huge range, and gets you a usable sound in ten seconds. This is the one to reach for when you have an idea and do not want to lose it to sound design. Free additional preset packs download from inside the plugin. Start here for pads, plucks, keys and basses.

FL Keys. An electric piano. Play seventh and ninth chords on it and you are immediately in deep house territory. It is not a great Rhodes emulation and that does not matter, because a slightly cheap Rhodes is exactly what those records used.

Transistor Bass. FL's Roland TB-303 emulation. This is the acid house instrument, and having it bundled is genuinely lucky. Program a sixteenth-note pattern, turn resonance high, sweep the cutoff, and use the slide and accent controls. Without slide and accent you have a filtered bass; with them you have acid. See `THEORY/02_chicago_house.md` for why this matters in Chicago specifically.

3x Osc. Three oscillators, a filter, two envelopes. Deliberately primitive, and the best possible teaching instrument because there is nowhere to hide. Do the one-hour exercise at the end of `THEORY/05_sound_design.md` in this plugin.

Sytrus. FM synthesis. Reach for it when you need bells, metallic tones, electric pianos or aggressive basses that subtractive synths cannot produce. Harder to control. Learn it third or fourth, not first.

FPC. A drum pad sampler. Useful once you are loading your own kits rather than dragging individual samples into the Channel Rack.

Honourable mentions you can ignore for six months: **Harmor** (extremely powerful additive and resynthesis engine, steep learning curve), **Slicex** (chopping breaks and vocals, essential if you go toward footwork or jungle), **Drumaxx** (physically modelled drums), **Morphine**, **Ogun**, **Sawer**, **PoiZone**, **Kepler**.

16.0.2 The effects you will use every session

Fruity Parametric EQ 2. The EQ. Highpass filters, surgical cuts, everything. You will put this on more channels than any other plugin.

Fruity Limiter. Does three jobs: limiting on the master, compression (switch to the COMP tab), and

sidechain compression. The sidechain function is why it matters. See `FL_STUDIO/03_first_track.md`.

Fruity Reeverb 2. The reverb. Put it on a send, not on individual channels.

Fruity Delay 3. Tempo-synced delays, including the dotted-eighth setting that is standard across dance music.

Fruity Balance. Just volume and pan, with no processing. Useful for trimming levels before other plugins.

Fruity Compressor. A straightforward compressor for when you do not need the Limiter's extra features.

16.0.3 The effects worth knowing about

Maximus. Multiband compression and limiting. This is a mastering-grade tool and it is bundled. Overkill for now, but it is what you graduate to.

Soundgoodizer. A simplified front end for Maximus with one knob. It is a cheat, it is slightly embarrassing, and it makes things sound better. Use it on the master while you are learning, and stop using it once you understand what it is doing.

Vintage Chorus. Emulates the chorus circuit found on old Roland polysynths. Put it on a pad and you are much closer to the Juno-60 sound that made "Can You Feel It" sound the way it does.

Gross Beat. Time and volume manipulation with sixteen storable patterns. Two uses: instant stutter and glitch effects, and as an alternative sidechain tool where you draw the volume shape by hand. Widely used and instantly recognisable.

Fruity Peak Controller. Lets any signal control any parameter. The classic use is sidechaining, but it can also make a filter open in time with the kick.

Fruity Love Philter. A multi-stage filter with envelope control. Good for the big filter sweeps in breakdowns.

Transient Processor. Adjusts attack and sustain separately. Makes a soft kick punchy or a sharp clap rounder, and it is more precise than compression for that job.

Fruity Blood Overdrive and **Fruity Fast Dist.** Distortion and saturation. A small amount on a kick or bass adds harmonics that make the low end audible on small speakers.

Fruity Stereo Enhancer. Width control, and importantly the ability to force low frequencies to mono, which you should be doing below about 150 Hz.

Edison. A full audio editor inside FL. Record, trim, reverse, clean up and export samples. Reversing a crash cymbal for a transition is a two-minute job in here.

Newtone. Pitch and time correction for vocals and monophonic audio. If you ever record singing, this is your tool.

Vocodex. A vocoder, for robot voices. Not core, but fun and historically appropriate.

Wave Candy. Spectrum analyser and oscilloscope. Put one on the master so you can see what your low end is doing rather than guessing on speakers that cannot reproduce it.

16.0.4 What you do not need to buy

Nothing, for at least a year.

The plugins people will tell you to buy are Serum or Vital for wavetable synthesis, Kickstart for sidechaining, and a good reverb. Vital is free and genuinely excellent, so if you want a modern wavetable synth,

get that. The other two duplicate things you already have.

Sample packs are a more defensible purchase than plugins, because good drum samples save real time. But you have the entire 909, 808 and 707 palette bundled already, and those are the correct sounds for what you are making.

16.0.5 A rule for plugin browsing

Pick one instrument per session and use only that one. Constraint produces finished tracks; choice produces afternoons spent auditioning presets.

Chapter 17

Troubleshooting

The problems that stop beginners, and their fixes. Most of them are settings, not skill.

17.0.1 No sound at all

Check the audio device. F10, Audio tab. Device should be **FL Studio ASIO**. If it says something else, or "no device", that is your problem.

Check you are in the right mode. The toolbar shows PAT or SONG, and **L** toggles. Pattern mode plays only the selected pattern. If your notes are in the playlist and you are in Pattern mode, you hear nothing.

Check the master fader in the Mixer (F9) is not at zero.

Check the channel is not muted. The green LED to the left of each channel name in the Channel Rack.

Check Windows is not sending audio elsewhere. Bluetooth headphones connecting mid-session will silently steal the output.

If all else fails, **Ctrl+H** is panic, and clears stuck notes.

17.0.2 Crackling, popping, or stuttering

Your buffer is too small for what your CPU is doing.

F10, Audio tab, **Show ASIO panel**, and raise the buffer to 1024 samples. Latency goes up, which only matters when you are playing something in live.

If it still crackles, look at the CPU meter in the top-right of FL. If it is pinned:

- Right-click a channel and choose **Freeze** to render it to audio temporarily
- Reduce reverb instances by using sends instead of per-channel reverbs
- Increase the "Underruns" tolerance in audio settings
- Close Chrome, which is almost certainly using more CPU than FL is

17.0.3 Everything I play is late

Latency. Lower the buffer to 256 or 128 samples in the ASIO panel, and make sure you are on FL Studio ASIO rather than a generic Windows driver.

There is a tradeoff: lower buffer means lower latency and higher CPU load. Use a small buffer while recording or playing in, and a large one while mixing.

17.0.4 I hear only drums when I press play

Pattern mode. Press **L** to switch to Song mode.

This is the single most common confusion in FL Studio and it catches everyone at least twice.

17.0.5 My pattern is in the playlist but nothing plays

Check the playlist track is not muted (the small LED on each lane).

Check the clip is actually on the timeline where the playhead is, not sitting before bar 1.

Check the pattern actually contains notes. An empty named pattern looks identical to a full one from the outside.

17.0.6 I cannot EQ one sound without affecting everything

Your channels are all going to the Master. Select them in the Channel Rack and press **Ctrl+L** to give each its own mixer track.

17.0.7 My kick and bass sound muddy together

Three fixes, in order of effort:

Move the bass notes to the offbeats so they never sound at the same instant as the kick.

Highpass the bass above the kick's fundamental with Fruity Parametric EQ 2.

Sidechain the bass to the kick. See `03_first_track.md`.

Also check that the kick is tuned near your track's key. A kick whose pitch clashes with the bass produces a beating you will hear as mud. See `THEORY/07_mixing.md`.

17.0.8 The exported file sounds different from the project

Almost always one of three things.

The tail was cut. In the export dialog, set **Tail** to **Leave remainder** so reverb and delay tails finish.

Only part exported. If you have a time selection in the playlist, FL exports only that range. Click an empty area of the timeline to clear the selection first.

It is quieter. Your project has no limiter on the master. Add Fruity Limiter with the ceiling at -1 dB.

17.0.9 The exported file is distorted

Your master is clipping. Turn individual channels down, not the master fader. Aim for the master peaking at around -6 dB before you add a limiter.

17.0.10 I lost my project

FL autosaves aggressively into `Documents\Image-Line\FL Studio\Projects` with names like `untitled (autosaved at 21h49).flp`. There is also a `Backup` folder in there.

You already have several of these from May. Long term, save with real names and use **Ctrl+N** deliberately (it saves an incremented version) at milestones.

17.0.11 A plugin window disappeared

F12 closes all windows, and it is easy to hit by accident. To get a plugin back, click the channel's name button in the Channel Rack, or find it in the Browser under **Current project**.

17.0.12 The project opens with missing samples

FL stores sample paths, and moving or renaming files breaks them. When prompted, point FL at the new location.

To avoid it: **Tools > Macros > Prepare for sharing** collects every sample the project uses into the project folder.

17.0.13 Everything is too quiet compared to real records

Commercial tracks are mastered. Yours is not.

Put Fruity Limiter on the master with the ceiling at -1 dB and raise the gain. If you want a shortcut while learning, Soundgoodizer on the master, knob at about 30%.

Do not chase commercial loudness. Streaming services normalise it away, and a well-arranged quiet track beats a loud badly-arranged one. See `THEORY/07_mixing.md`.

17.0.14 It does not sound like the records I like

This one is not a settings problem, and it is worth saying plainly: this gap does not close by finding the right plugin. It closes by finishing tracks, referencing against commercial releases while you mix, and accumulating hours.

The specific thing that helps fastest is **referencing**. Load a track you admire into your project, level-match it, and A/B constantly. You will hear exactly which of your elements is wrong within about two minutes, which is much faster than guessing.

17.0.15 Where to get help

Image-Line's own manual is genuinely good and it is installed locally (F1 opens it, though in this version most pages redirect to the web).

The Image-Line forums are active and the moderators are the actual developers.

For anything conceptual rather than mechanical, the files in `THEORY/` in this folder will usually cover it.

Part III

Practice

Chapter 18

An eight week plan

The most important file in this folder, because the thing that stops people is not lack of knowledge. It is making forty loops and finishing nothing.

Assumes three to five hours a week, in sessions of an hour or more. If you get less than that in a given week, cut the reading, not the making.

> **In short.** You finish and export four tracks in eight weeks. Finished means arranged, mixed badly, exported to MP3, and filed. Not good. Finished.

18.0.1 Week 1: get all the way through the pipeline once

Read `FL_STUDIO/00_setup.md` and do the setup, including the template.

Do `FL_STUDIO/02_first_beat.md` end to end.

Do `FL_STUDIO/03_first_track.md` end to end, including the export. Give yourself one session for this and do not stop halfway.

Read `THEORY/01_what_edm_is.md`.

Deliverable: track 1, exported. It will be bad. File it in a folder called `01_finished` and do not touch it again.

The point of week 1 is to prove the pipeline works. Every subsequent week improves one part of a process you have already completed once.

18.0.2 Week 2: drums

Read `THEORY/03_rhythm.md` properly.

Make **five different eight-bar drum loops**. Not tracks, just loops. Different tempos: 118, 122, 124, 126, 128. Save them all.

Do the ear-training exercise from `exercises.md`: clap the offbeat through three full tracks.

Then pick one Chicago house record and rebuild its drum pattern by ear, using only the bundled 909 samples. Spend at least an hour on this. It is the single highest-value exercise in the whole plan.

Deliverable: five loops and one transcription.

18.0.3 Week 3: harmony

Read `THEORY/04_harmony.md`.

In FL, make a two-bar chord loop in A minor using seventh chords, and voice-lead between them properly. Then transpose the same loop to F minor and to C minor without changing the shape.

Write five different basslines over the same chord loop: root notes on offbeats, octave bounce, a walking line, one that syncopates against the kick, and one that plays only on beat 1.

Then combine week 2's best drum loop with this week's best chords and bass.

Deliverable: track 2, arranged and exported. Use the arrangement table from `FL_STUDIO/03_first_track.md` again. Reusing a structure is not cheating.

18.0.4 Week 4: sound design

Read `THEORY/05_sound_design.md`.

Do the one-hour 3x Osc exercise at the end of that file. All six steps, slowly, listening.

Then spend a session with **Transistor Bass** making an acid line. Sixteenth notes, high resonance, and automate the cutoff across sixteen bars. This is the Chicago instrument and it deserves its own session.

Make three sounds from scratch with no presets: a bass, a pad, a pluck.

Deliverable: three patches and one acid loop. No finished track this week.

18.0.5 Week 5: arrangement

Read `THEORY/06_arrangement.md`.

Take your best loop so far and arrange it using the **top down** method: copy the full loop across 128 bars, then delete elements to carve out the intro, breakdown and build.

Focus this week entirely on the build and the drop. Spend an hour just on bars 81 to 97. Riser, filter automation, hat roll, silence before the drop, crash on the downbeat.

Deliverable: track 3, exported. This one should be noticeably better than track 1.

18.0.6 Week 6: mixing

Read `THEORY/07_mixing.md`.

Take track 3 and remix it from scratch levels. Highpass everything except kick and bass. Set up two reverb sends. Get the sidechain working properly with Fruity Limiter rather than volume automation.

Do the referencing exercise: load a commercial Chicago house track into your project, level-match, and A/B for a full hour.

Deliverable: track 3, remixed. Compare the two exports back to back.

18.0.7 Week 7: speed

Read `THEORY/08_genre_map.md` and pick a subgenre you have not tried.

Then do the constraint exercise: **make a complete track in one three-hour sitting.** One synth, four drum sounds, no presets browsing, no going back. Export whatever you have at the three hour mark.

Speed exercises work because they remove the option of perfectionism. You will be surprised how much of your normal session is spent deciding rather than doing.

Deliverable: track 4, exported.

18.0.8 Week 8: consolidate

Listen to tracks 1 through 4 in order. Write down, for each, one thing that is better than the previous one and one thing that is still wrong.

That list is your curriculum for the next eight weeks.

Then pick whichever of the four has the most in it, and spend the whole week making it actually good. This is the first time in the plan you are allowed to polish.

Read `LISTENING/chicago_scene_today.md` and go to one thing. A club night, a record shop, a festival.

Deliverable: one track you are not embarrassed by, and a plan for what to learn next.

18.0.9 Rules that make this work

Finish badly rather than not at all. A finished bad track teaches you more than an unfinished good loop, because the last 20% is where all the skills you are missing live.

Time-box. Set a timer. When a session ends, save and stop, even mid-idea. Especially mid-idea, because you will want to come back.

Do not restart projects. The urge to start fresh because ”this one is not working” is the enemy. Finish it, then start fresh.

Keep a `01_finished` folder and put everything in it. Being able to hear month one against month six is the main reward available in the early period, and it is a real one.

Do not buy anything. Not plugins, not sample packs, not a controller. You have more than you can use. Buying things feels like progress and is not.

One reference track per session. Pick a Chicago record, have it loaded, A/B against it.

18.0.10 What eight weeks will and will not get you

It will get you: fluency in FL Studio, a working mental model of how house is built, four finished tracks, and the ability to hear what is happening in a record.

It will not get you: tracks that sound like the records you like. That takes years, and everyone underestimates it. The gap between your taste and your ability is at its widest right now and it closes slowly.

That gap is the normal condition of learning anything. You have a PhD; you already know what the first year of not being good at something feels like.

Chapter 19

Drills

Short, repeatable exercises. Each has a time box. Do one at the start of a session as a warm-up, or use them when you are stuck.

They are grouped by what they train.

19.0.1 Ears

Clap the offbeat. 15 minutes. Put on a house record. Clap on the "&" between the kicks, not on the kick. Do it for three full tracks without losing it. Harder than it sounds, and it rewires how you hear the genre. Progress: do it while walking, or while doing something else.

Count the phrase. 20 minutes. Play a track and count bars out loud in groups of eight. Write down the bar number of every change: when the bass enters, when the drums drop out, when the drop lands. Check whether they are all multiples of 8. They will be.

Name the tempo. 10 minutes. Play a track and guess the BPM before checking. Tap along and count beats for 15 seconds, multiply by 4. Do this ten times. Within a week you will be within a few BPM by feel.

Identify the drum machine. 10 minutes. Play five house or techno records and decide whether the kick is a 909, an 808 or something sampled. Then load the samples in FL and compare. The 909 click and the 808 sustain become obvious quickly.

Reference A/B. 60 minutes. Load a commercial track into your project alongside your own. Turn the reference down to match your level. Switch between them every ten seconds while you mix. Do this for a full hour. It is the fastest mixing feedback available and it costs nothing.

19.0.2 Rhythm

Transcribe a drum pattern. 60 minutes. Pick a track. Rebuild its drum pattern in FL by ear, one element at a time: kick first, then clap, then hats, then percussion. Use only the bundled 909 samples.

This is the highest-value exercise in the folder. Do it once a week for a month and your drum programming will be unrecognisable.

Five loops, five tempos. 45 minutes. Make five different eight-bar drum loops at 118, 122, 124, 126 and 128 BPM. Notice how the tempo changes what patterns feel right. Fast tempos want simpler patterns.

Swing sweep. 10 minutes. Take one loop. Set swing to 0%, then 10%, 20%, 30%, 40%. Listen at each.

Find where it stops feeling good. Now you know your own preference and you will set it deliberately instead of leaving it at zero.

Velocity only. 20 minutes. Take a flat sixteenth-note hi-hat pattern where every hit is identical. Change nothing except velocity, using the graph editor. Make it groove. No new notes allowed.

Three against four. 15 minutes. Put a percussion sound on every third sixteenth. Let it run for eight bars and hear it cycle against the bar. Then find a way to make it resolve.

19.0.3 Harmony

Two chords, ten ways. 30 minutes. Take Am7 and Dm7. Write ten different versions: different voicings, different inversions, different rhythms, stabs versus pads, different octaves. Same two chords throughout.

Voice leading. 20 minutes. Write a four-chord progression twice. Once with every chord in root position, jumping around. Once with proper voice leading, moving each note as little as possible. Listen to both. The difference is larger than you expect.

Bassline variations. 30 minutes. One chord loop, five basslines: root on offbeats, octave bounce, a line using the fifth and minor seventh, one that plays only on beat 1, and one that syncopates against the kick.

Transpose. 15 minutes. Take a finished chord loop in A minor. Move it to F minor, then C minor, then G minor, without changing the shape. Confirms you understand that the pattern is what matters, not the specific notes.

Steal a progression. 30 minutes. Find the chords of a deep house record by ear. Play the bass note first to find the root, then work out whether the chord above it is major or minor, then whether it has a seventh. Slow work at first. Gets much faster.

19.0.4 Sound design

The 3x Osc hour. 60 minutes. The six-step exercise at the end of `THEORY/05_sound_design.md`. Do it once, properly, with nothing else open.

One synth, three sounds. 45 minutes. Pick one synth. Make a bass, a pad and a pluck from the initialised patch. No presets.

Acid line. 45 minutes. Transistor Bass, sixteenth-note pattern, high resonance. Automate the cutoff across sixteen bars. Add slide and accent to individual notes. This is a Chicago-specific skill and worth its own session.

Recreate a sound. 60 minutes. Pick one sound from a record you like. Try to build it from scratch. You will fail, and the failure tells you exactly which part of synthesis you do not understand yet.

19.0.5 Arrangement

Subtract. 45 minutes. Take a full eight-bar loop with six or more elements. Copy it across 64 bars. Now only delete. Build an intro, a breakdown and a build purely by removing things. Add nothing.

The build. 60 minutes. Take any loop. Spend a full hour on just the sixteen bars before the drop. Riser, filter automation, hat roll accelerating from 1/8 to 1/32, silence in the last half bar, crash on the downbeat. One hour on sixteen bars.

Eight variations. 45 minutes. Take one eight-bar loop. Make eight versions, each with exactly one thing different. Then arrange them in sequence. You now have 64 bars that develop.

Copy an arrangement. 45 minutes. Take a record you like. Write down its full structure with bar numbers. Then build your own track into exactly that structure using your own sounds.

19.0.6 Finishing

The three hour track. 3 hours. Start from empty. Export something at the three hour mark, whatever state it is in. One synth, four drum sounds, no preset browsing.

Removes the option of perfectionism, which is the actual obstacle for most people.

The one-loop track. 90 minutes. Make a single two-bar loop. Build an entire five-minute track using only that loop plus filtering, muting and automation. No new musical material allowed.

Teaches the thing that separates dance music from other genres: how much you can get from variation alone.

Finish an abandoned project. 2 hours. Open something you gave up on. Do not improve it. Just arrange it, mix it roughly, and export it. You have two of these from May already.

The deadline. 1 week. Pick a track. Set a date. On that date it gets exported and filed regardless of state. Repeat until finishing stops feeling like a decision.

19.0.7 A note on how to use these

Do not do them all. Pick the one that addresses whatever is currently annoying you about your tracks.

If you do not know what is annoying you, do the reference A/B for an hour. It will tell you.

Part IV

Listening

Chapter 20

The Chicago canon

Listening with a producer's ears is a different activity from listening for pleasure. For each of these, there is a specific thing to listen for. Put the track on, ignore everything else, and follow just that one element for three minutes.

Almost all of this is on streaming. Where a record is hard to find, it is usually on YouTube.

20.0.1 The founding six

Start here. Six records, roughly two hours including the long versions.

Jesse Saunders, "On and On" (1984). Usually cited as the first house record pressed to vinyl. *Listen for:* how little is happening. A drum machine, a bassline, a few stabs. This is the entire genre in its most reduced form, and it will sound almost comically primitive. That is the point. You can make this today in an afternoon.

Marshall Jefferson, "Move Your Body" (1986). *Listen for:* the piano. Jefferson bought a piano on credit and taught himself the riff by trial and error, and putting a real acoustic instrument into a drum-machine record created piano house on the spot. Notice the riff is simple enough that you could learn it in ten minutes, and notice that it does not matter.

Mr. Fingers, "Can You Feel It" (1986). Larry Heard made this on a Roland Juno-60 and a TR-909 and almost nothing else. *Listen for:* the space. Count how few elements there are at any moment. The bassline is doing the emotional work and the pad is doing the atmosphere, and there is no melody at all. This is the deep house template and it has never been improved on.

Phuture, "Acid Tracks" (1987). *Listen for:* the 303 line changing while never changing. The notes are the same throughout; what moves is the filter cutoff and resonance. Twelve minutes of one bassline, and it holds. This is the clearest possible demonstration that timbre can carry a record when harmony and melody do not.

Steve "Silk" Hurley, "Jack Your Body" (1986). The one that went to number one in the UK. *Listen for:* the arrangement, specifically how elements drop in and out. It is a lesson in how much mileage you get from muting things.

Farley "Jackmaster" Funk, "Love Can't Turn Around" (1986). *Listen for:* Darryl Pandy's vocal, which is enormous, gospel-derived, and completely uninterested in restraint. This is the other pole of Chicago house: not machine music, but soul music that happens to have a drum machine under it.

20.0.2 The deep strand

Where the chords are. If you want to learn house harmony, steal from these.

Mr. Fingers, "Mystery of Love" (1985). *Listen for:* the chord voicings. Seventh and ninth chords, spaced widely, moving slowly.

Fingers Inc., "Bring Down the Walls" (1986), with Robert Owens singing. *Listen for:* how the vocal and the track are equal partners rather than one sitting on top of the other.

Ron Trent, "Altered States" (1990). Trent was still a teenager. *Listen for:* the length and the patience. Nothing is in a hurry, and the track trusts you to stay with it.

Larry Heard presents Mr. White, "The Sun Can't Compare" (2005). Proof that the man was still doing it twenty years later. *Listen for:* the bassline, which is a proper melodic line rather than root notes.

20.0.3 The anthems

House with something to say, usually about a better world. The gospel inheritance is undisguised.

Joe Smooth, "Promised Land" (1987). *Listen for:* the chord progression, which is straightforwardly uplifting in a way most house avoids.

CeCe Rogers, "Someday" (1987). *Listen for:* the piano and the vocal arrangement.

Ten City, "Devotion" (1989). *Listen for:* the strings and the production polish. By 1989 house had proper budgets.

Jamie Principle and Frankie Knuckles, "Your Love" (1986). *Listen for:* the arpeggio, which is one of the most recognisable four bars in dance music, and how slowly everything else moves underneath it.

20.0.4 Acid and the harder side

Adonis, "No Way Back" (1986). *Listen for:* the bassline and the sense of menace. Very few elements, very dark.

Armando, "Land of Confusion" (1988). *Listen for:* the relentlessness. This is where acid house starts turning into techno.

Lil Louis, "French Kiss" (1989). *Listen for:* the tempo breakdown in the middle, where the whole record slows almost to a stop and then rebuilds. Nobody had done that. It works because a dance floor will follow you anywhere if you commit.

20.0.5 The nineties, when Chicago went global

Cajmere, "Percolator" (1992). *Listen for:* the single sound the whole record is built around. One weird bubbling noise, and that is the hook.

Green Velvet, "Flash" (1995) and "La La Land" (2001). Same person as Cajmere. *Listen for:* the spoken vocal used as a rhythmic element, and the deliberate weirdness. Curtis Jones has a chemical engineering degree, which explains nothing but is a good fact.

Paul Johnson, "Get Get Down" (1999). *Listen for:* the filtered disco loop. This is how much of house is made: find four bars of an old record, filter it, put drums under it.

DJ Sneak, "You Can't Hide From Your Bud" (1996). Same technique, more aggressive.

20.0.6 Ghetto house and footwork

The line from Chicago house to the present, and the part most outsiders never hear.

DJ Funk and **DJ Deeon**, anything on Dance Mania. *Listen for:* how stripped it is. Often just a 909, a bassline and a chant. No chords. It is house reduced to its skeleton and it is much harder to make well than it sounds.

RP Boo, "Baby Come On". *Listen for:* the triplet kick patterns and the enormous amount of empty space. Footwork removes far more than it adds.

DJ Rashad, *Double Cup* (2013). The album that took footwork worldwide. *Listen for:* how the vocal samples are chopped into fragments too short to carry meaning, and used purely as rhythm. Rashad died in 2014.

Traxman, for the direct line back to the Trax catalogue.

20.0.7 How to listen productively

Pick one track. Play it four times, and each time follow only one thing:

1. **The kick and the drums.** Where does each element enter? What is the hi-hat doing?
2. **The bassline.** What notes, what rhythm, does it move or repeat?
3. **The arrangement.** Count bars. Write down what happens at bar 16, 32, 64. You will find almost everything lands on a multiple of 8.
4. **The space.** What is *not* there? What did they leave out?

> **Listen for.** The fourth pass is the one that changes how you produce. Beginners add; these records subtract. Ask what was left out, not what was put in.

20.0.8 A note on the sound quality

Much of this was recorded on cheap equipment, mixed in a bedroom, and pressed on recycled vinyl by a label cutting corners. Some of it is genuinely badly made by any technical standard.

It does not matter, and noticing that it does not matter is useful. Your first tracks will also be technically poor. The question is whether the groove is right.

Chapter 21

The scene now

Checked in August 2026. Venues close and events move, so search before you travel.

21.0.1 The one that is coming up

ARC Music Festival, Union Park, **4 to 7 September 2026**. Expanded to four days this year. It is the big one, it is in the West Loop, and it deliberately programmes Chicago house originators alongside international techno acts.

If you are going to do one thing this year to connect with the music, this is the low-friction option, and it is about three weeks away as of writing.

21.0.2 Clubs

Smartbar, 3730 N Clark St, underneath Metro in Lakeview. Opened 1982, capacity around 400, still independent, and the only club from the original house era still operating. Frankie Knuckles, Derrick Carter and The Blessed Madonna have all held residencies. This is the single most important room in the city for what you are trying to learn, and a Tuesday night there costs very little.

Spybar, River North. Long-running, techno-leaning.

Sound-Bar, River North. Bigger, more mainstream.

Primary, West Town. House and techno, later hours.

The Promontory, Hyde Park. More live and soul-oriented, with house nights.

Cermak Hall / Radius, Pilsen. Large-format events.

A practical note: a lot of the best Chicago house happens at one-off parties and loft events rather than at fixed venues, and those are advertised on Resident Advisor and Instagram rather than anywhere findable. Following a few local DJs and promoters is more useful than checking club calendars.

21.0.3 Annual events

Chosen Few Picnic, Jackson Park, usually the first or second Saturday of July. The 2026 edition was 11 July, so the next is summer 2027. Known as the Woodstock of house music, it is free to attend in the general area, it has been running since 1990, and it is the closest thing the genre has to a family reunion. The Chosen Few DJs include Wayne Williams, Jesse Saunders, Terry Hunter and Alan King.

If you only go to one thing ever, go to this.

Chicago House Music Festival and Conference, run by the city, free admission, usually late May. The conference component has panels with people who were actually there in 1985.

Silver Room Block Party, Hyde Park, summer.

21.0.4 Record shops

Gramaphone Records, 2843 N Clark St, Lakeview. Trading since 1969 and focused on dance music since house took hold in the early 1980s. Deep 12-inch inventory, classics, imports and current club records. The staff are DJs and will talk to you if you ask sensible questions.

Dusty Groove, Ukrainian Village. Broader, strong on soul, disco and jazz, which is where house came from.

Reckless Records, several locations. General, but worth digging.

You do not need turntables to benefit from a record shop. Going in, asking what is good, and writing down names is a legitimate use of the place.

21.0.5 Radio and online

WHPK 88.5 FM, University of Chicago student radio, with long-running dance and house programming.

Chicago House FM, online.

5 Magazine (5mag.net) covers the Chicago scene specifically and has done for years. Their event calendar is more reliable than anything else for local house.

Resident Advisor for club listings, and **Do312** for general Chicago events.

21.0.6 Where to buy the music

Bandcamp pays artists better than anything else and Chicago producers use it heavily.

Beatport for DJ-oriented releases, with the key and BPM listed on every track, which is useful reference data even if you never DJ.

Discogs for finding out what a record actually is, who played on it, and what the pressing history was. The database is extraordinary.

21.0.7 If you want to meet people

Two honest observations.

The Chicago house community is welcoming to people who are genuinely interested and noticeably less welcoming to people who treat it as a genre to consume rather than a tradition with living participants. Knowing the names in `chicago_canon.md` goes a long way.

And the fastest route in is not networking, it is making things. Producers talk to producers who have tracks. Even bad ones. Turn up somewhere with something you made and you have a conversation; turn up with opinions and you have less of one.

21.0.8 Realistic first steps

1. Go to ARC in September, or to Smartbar on a weeknight.
2. Go to Gramaphone and buy something on the staff's recommendation.
3. Follow 5 Magazine's calendar for a month to learn who the local promoters are.
4. Stand outside 206 S Jefferson St once, which is the Warehouse, landmarked in 2024. It is an ordi-

nary building and that is somehow the point.
